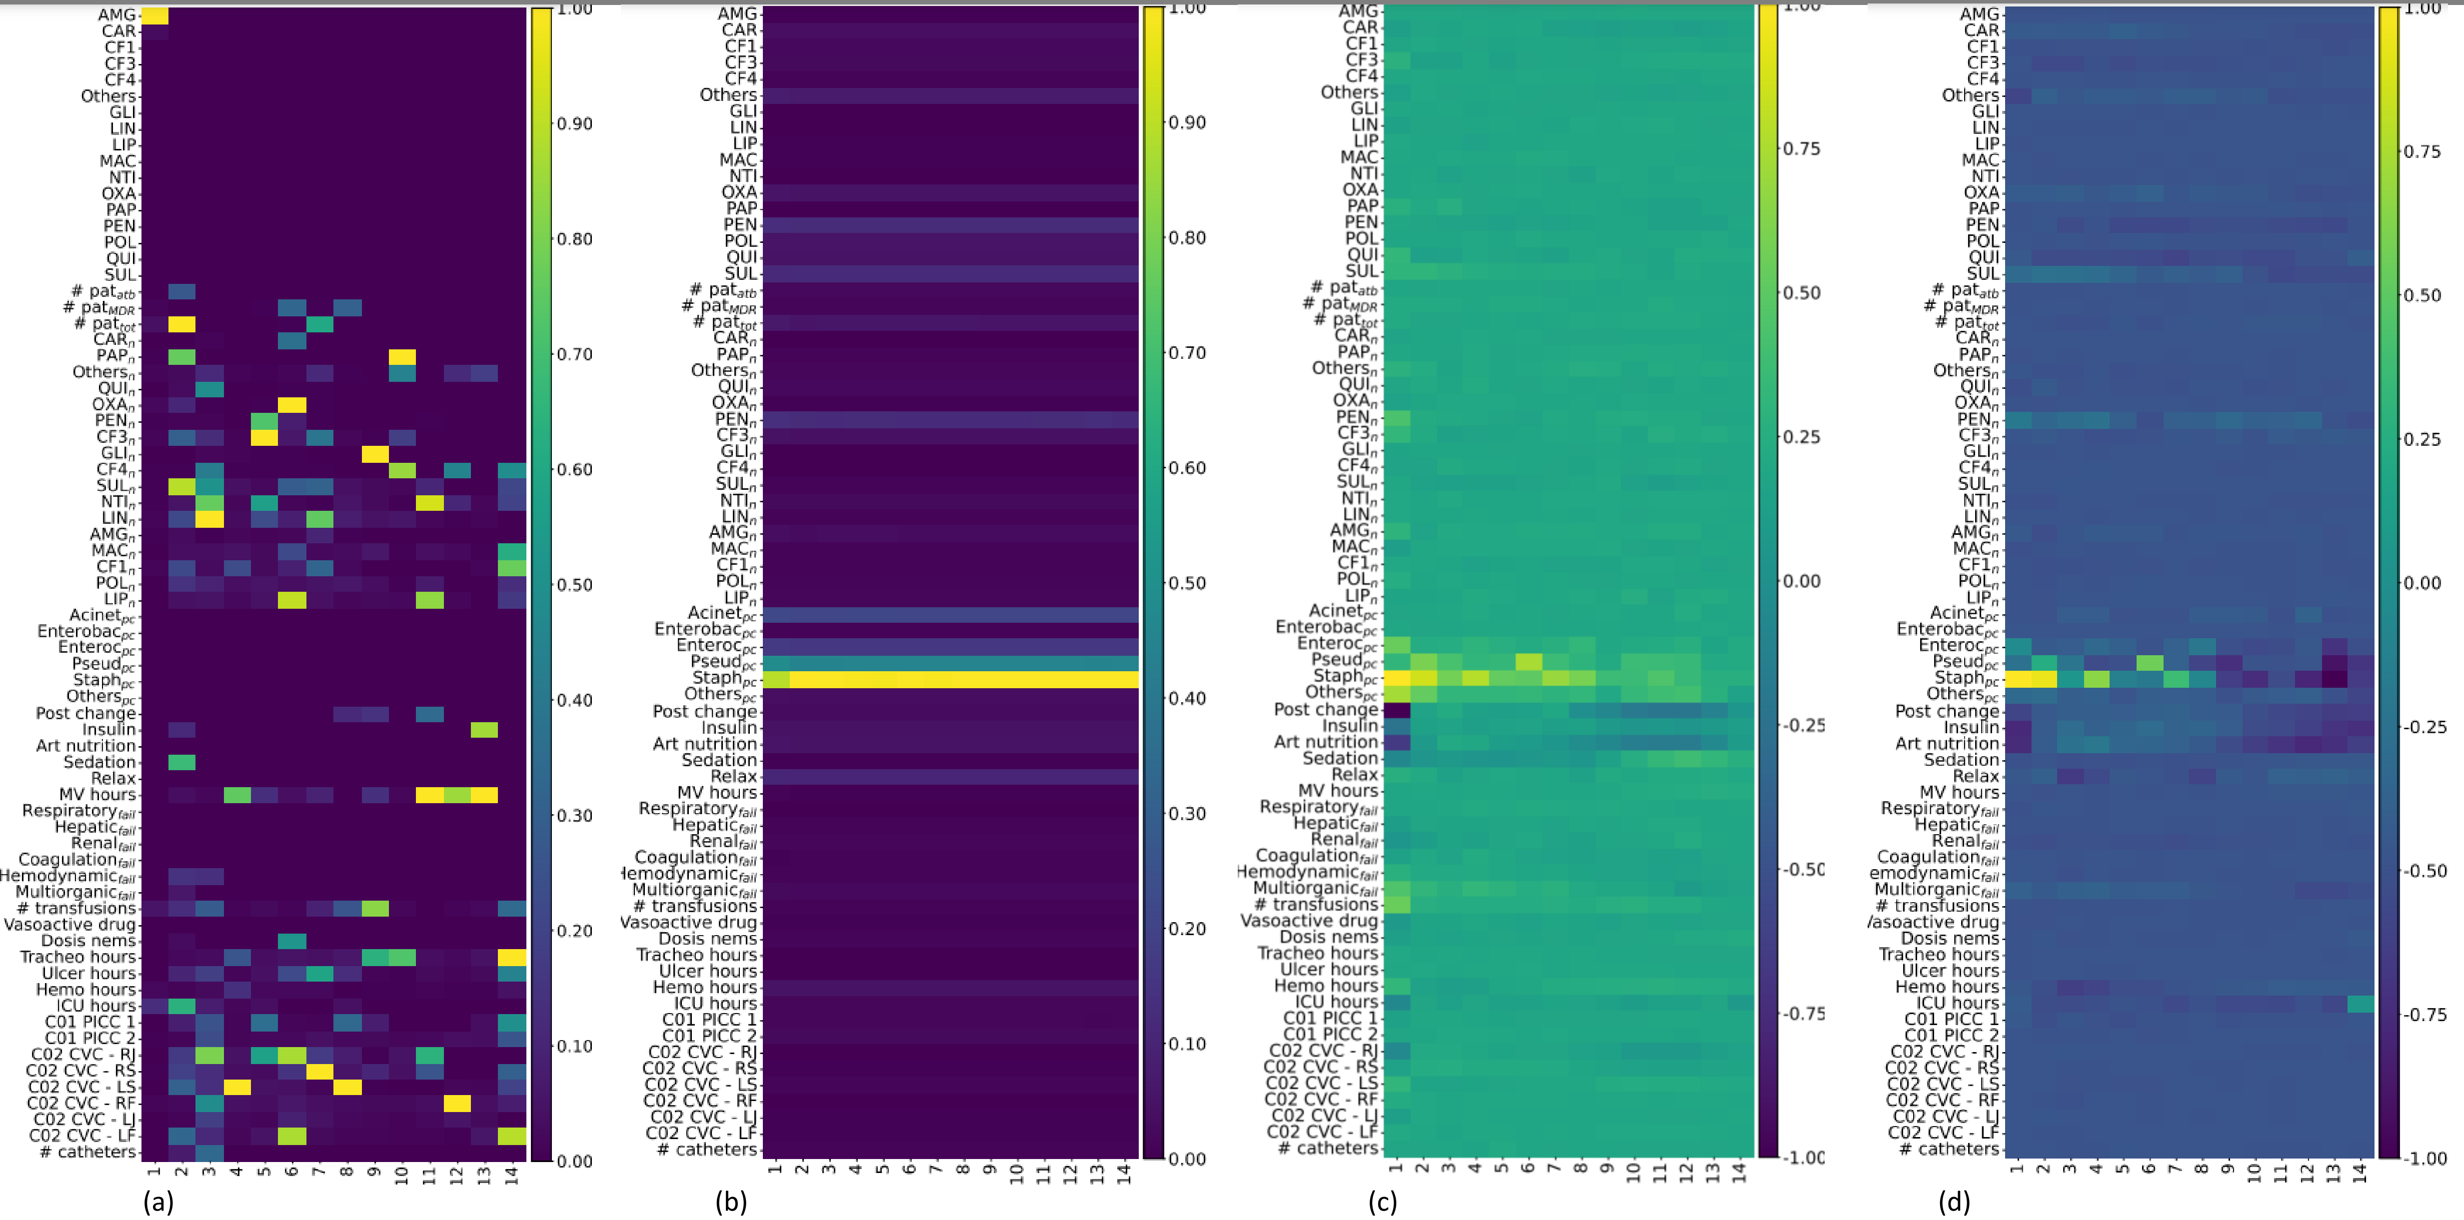
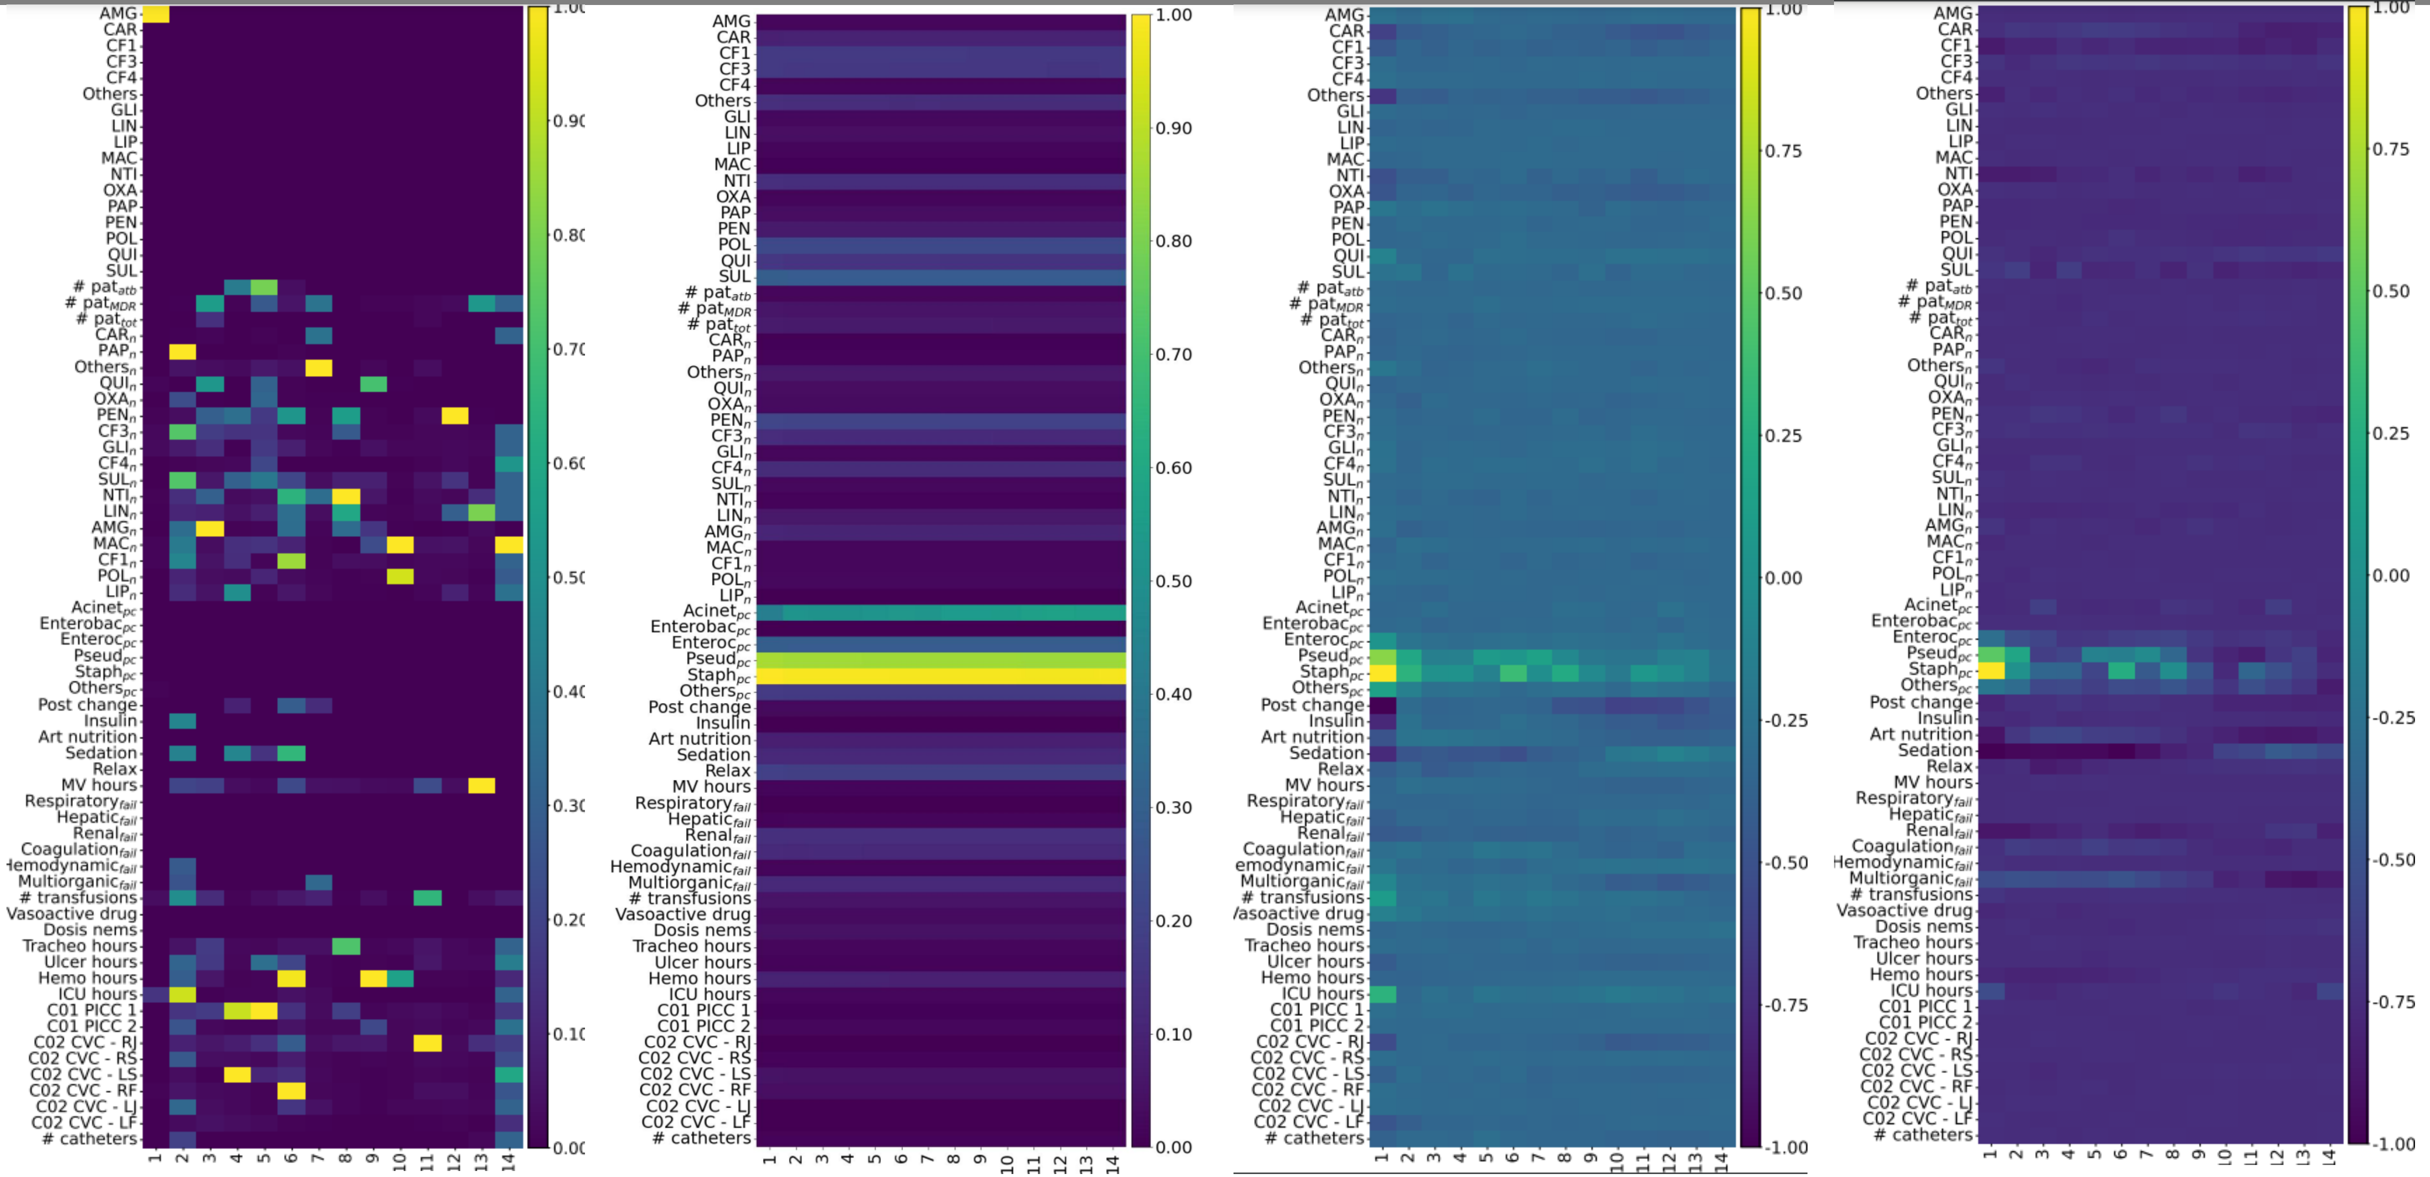
MULTIDRUG RESISTANCE – GRU (SPLIT 1)



Comparison of explainability methods for MDR prediction in the test set. (a) CCMI scores, (b) Hadamard attention weights, (c) IT-SHAPfeature contributions using an RNN without Hadamard attention, and (d) IT-SHAP feature contributions using an RNN with Hadamard attention. Thex-axis represents time steps, and the y-axis corresponds to variables under analysis, with the color scale indicating variable importance at eachtime step.

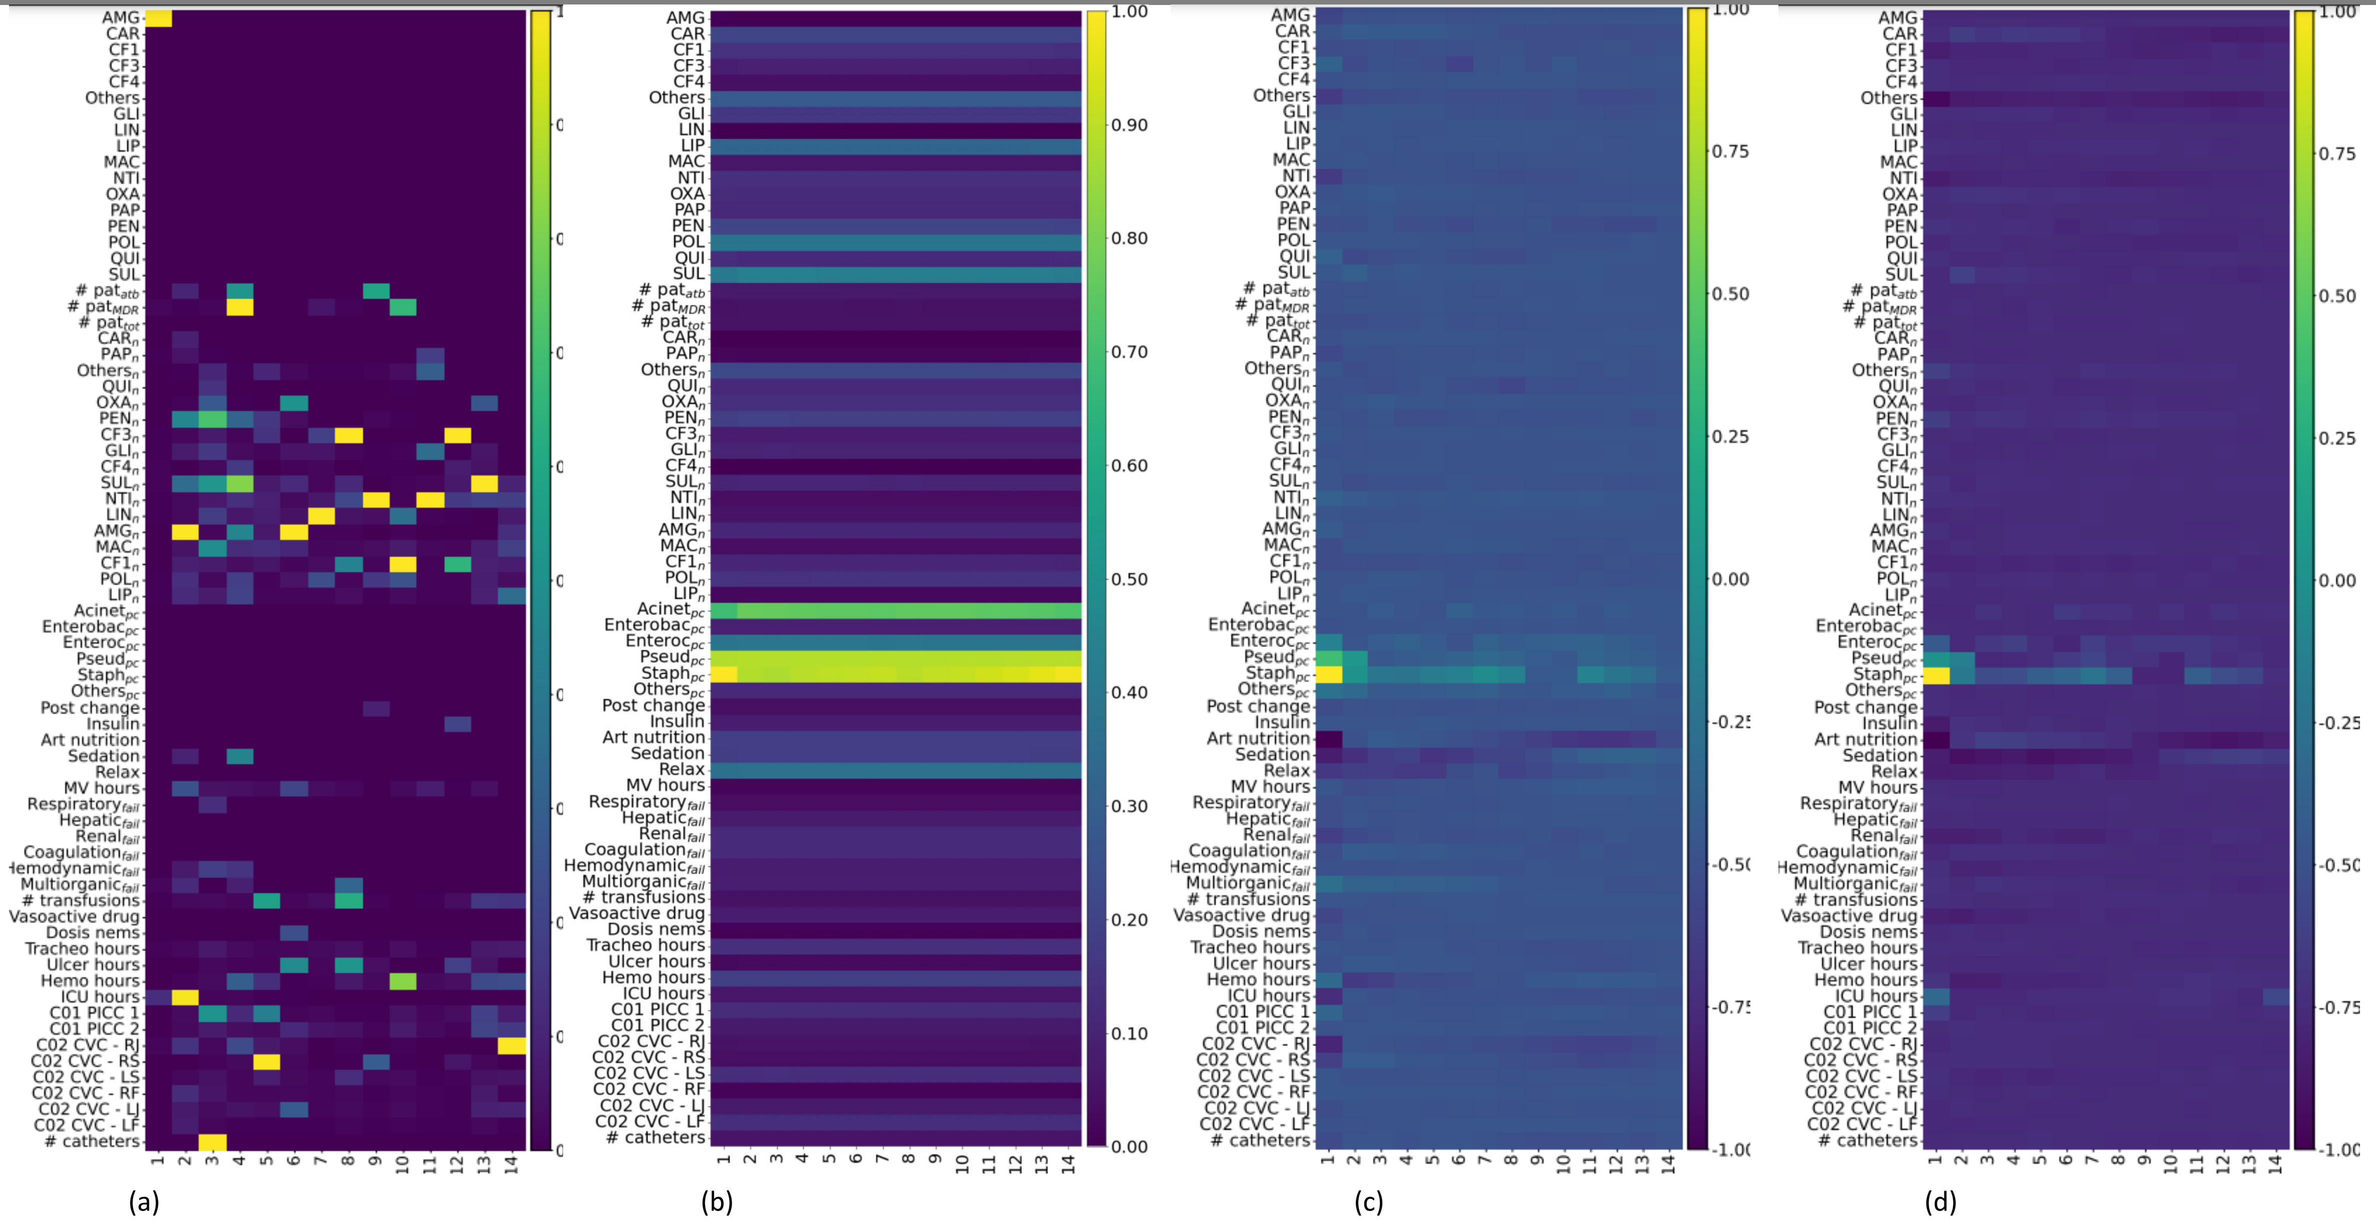
MULTIDRUG RESISTANCE – GRU (SPLIT 2)



(a) (b) (c) (d)

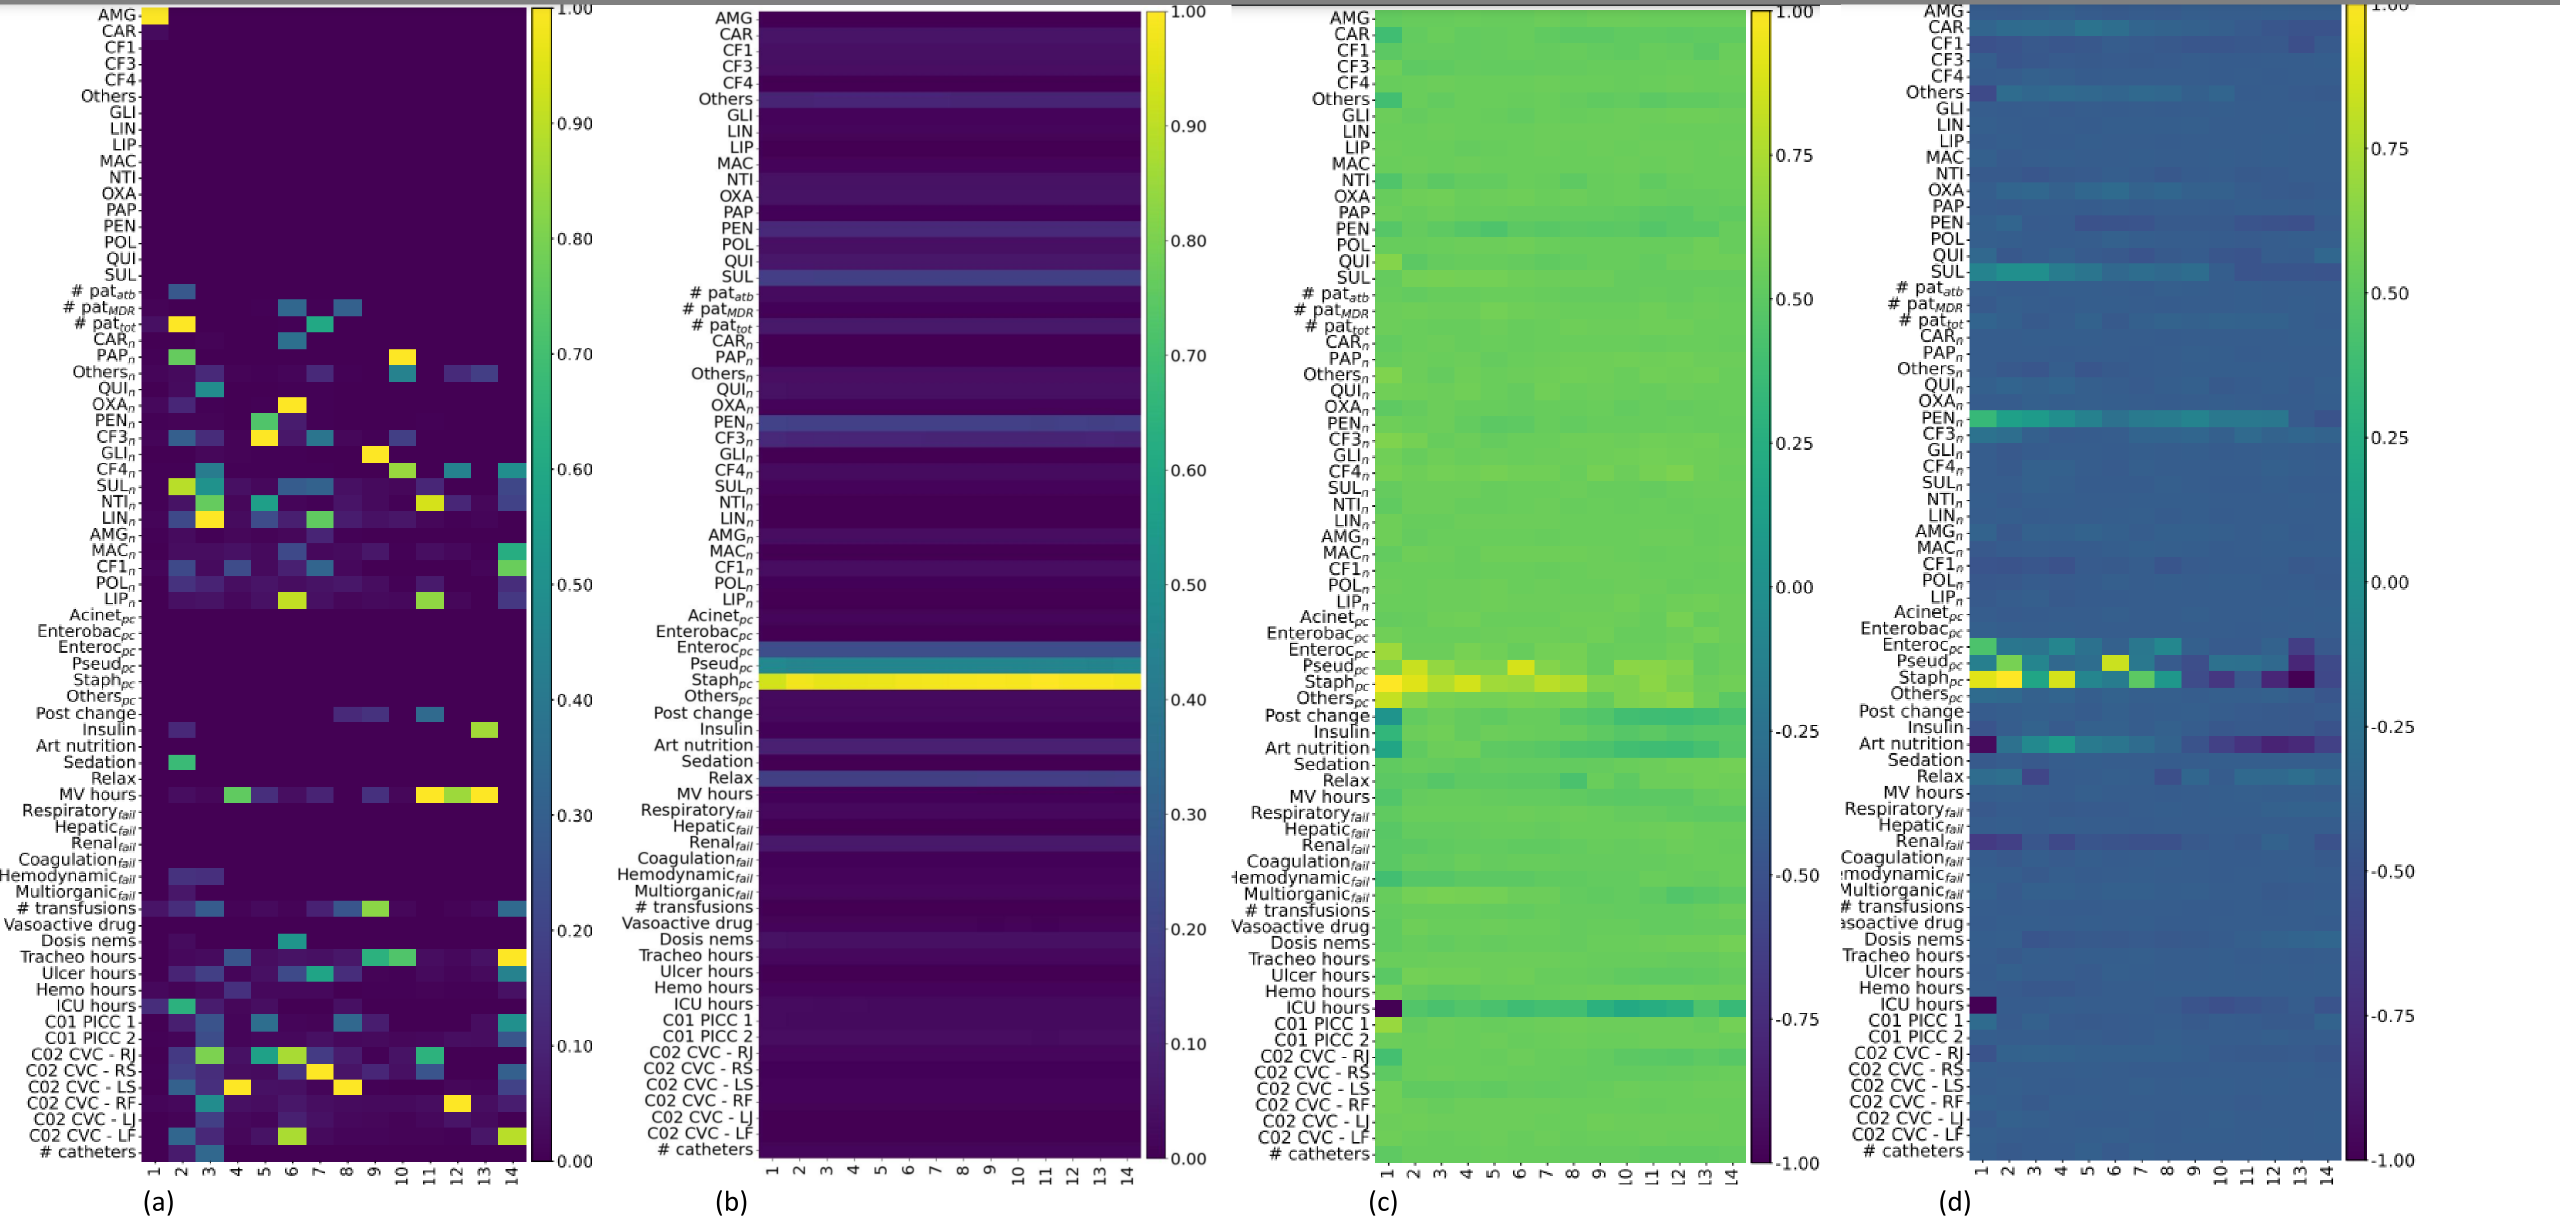
Comparison of explainability methods for MDR prediction in the test set. (a) CCMI scores, (b) Hadamard attention weights, (c) IT-SHAPfeature contributions using an RNN without Hadamard attention, and (d) IT-SHAP feature contributions using an RNN with Hadamard attention. Thex-axis represents time steps, and the y-axis corresponds to variables under analysis, with the color scale indicating variable importance at eachtime step.

MULTIDRUG RESISTANCE – GRU (SPLIT 3)



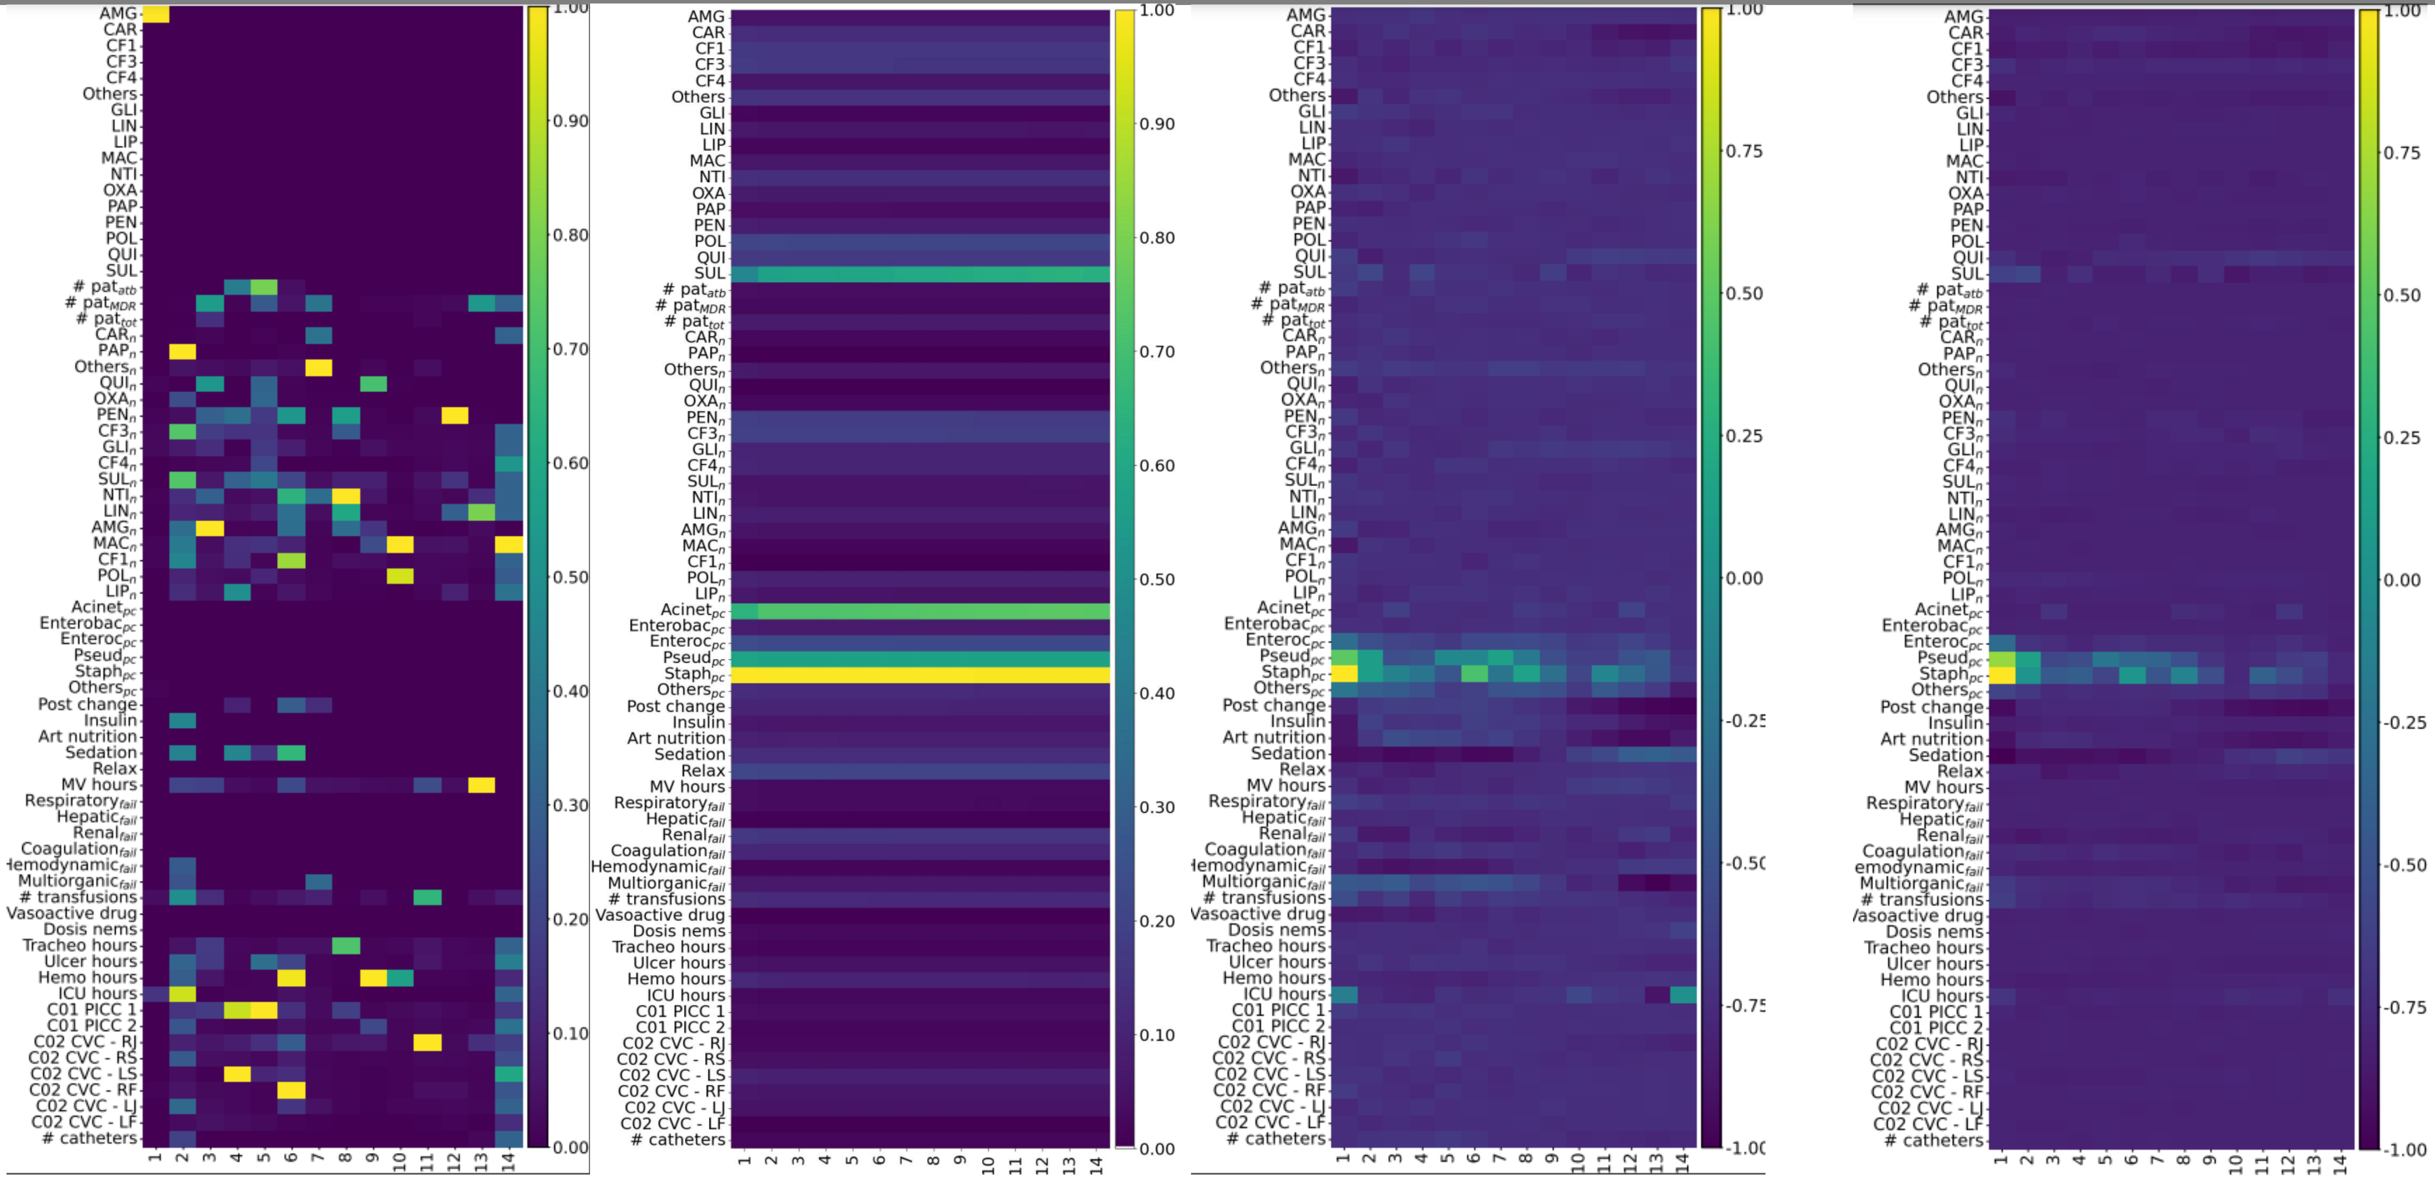
Comparison of explainability methods for MDR prediction in the test set. (a) CCMI scores, (b) Hadamard attention weights, (c) IT-SHAPfeature contributions using an RNN without Hadamard attention, and (d) IT-SHAP feature contributions using an RNN with Hadamard attention. Thex-axis represents time steps, and the y-axis corresponds to variables under analysis, with the color scale indicating variable importance at eachtime step.

MULTIDRUG RESISTANCE – LSTM (SPLIT 1)



Comparison of explainability methods for MDR prediction in the test set. (a) CCMI scores, (b) Hadamard attention weights, (c) IT-SHAPfeature contributions using an RNN without Hadamard attention, and (d) IT-SHAP feature contributions using an RNN with Hadamard attention. Thex-axis represents time steps, and the y-axis corresponds to variables under analysis, with the color scale indicating variable importance at eachtime step.

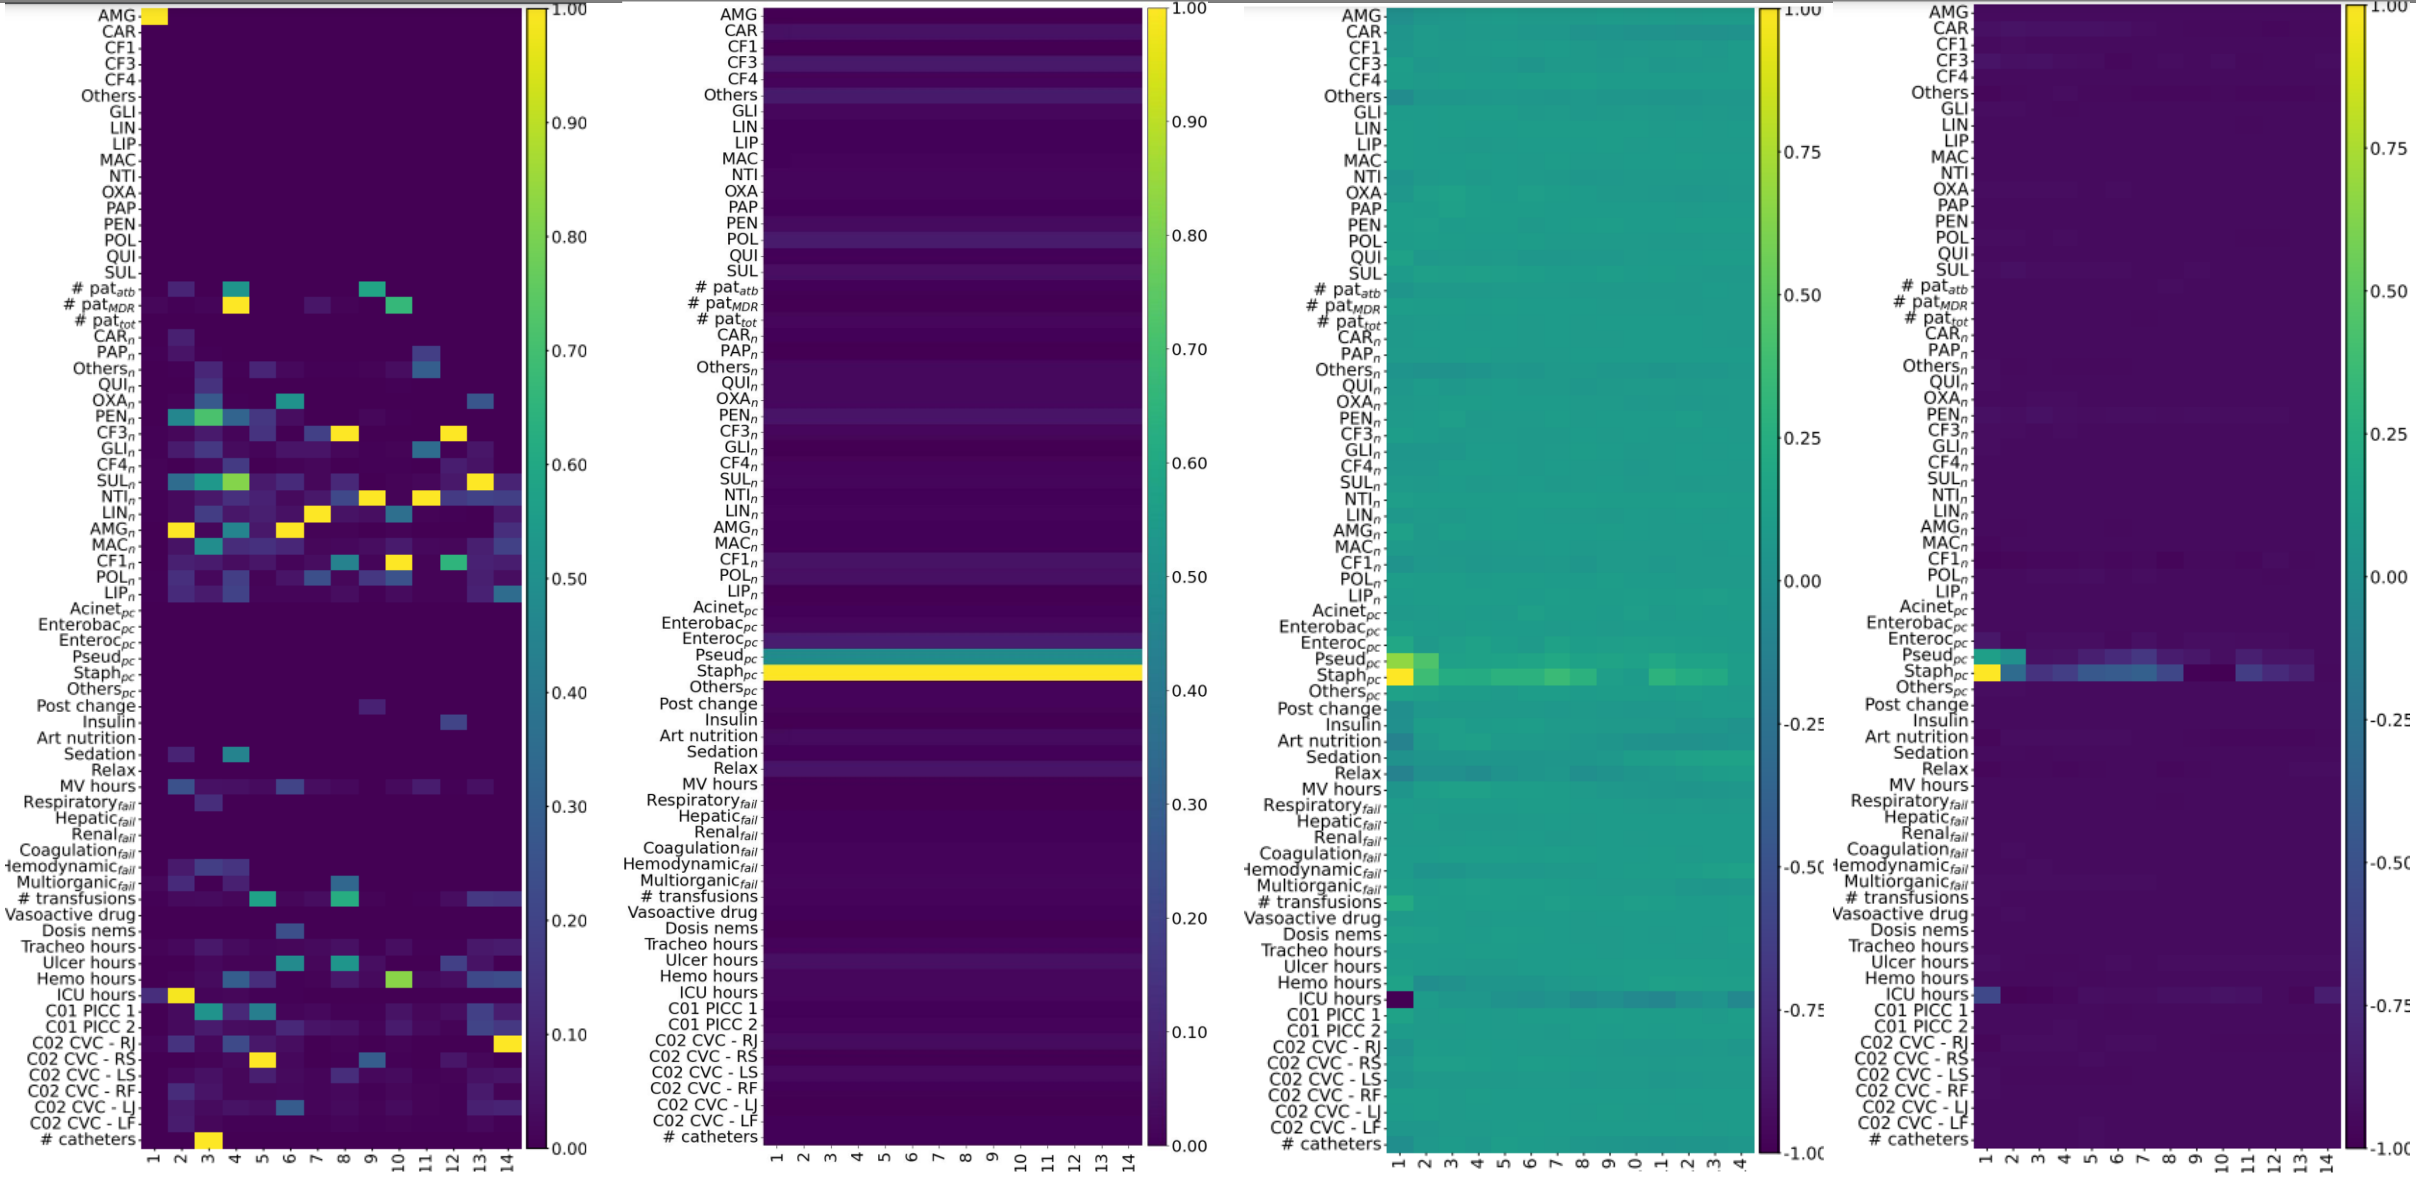
MULTIDRUG RESISTANCE – LSTM (SPLIT 2)



(a) (b) (c) (d)

Comparison of explainability methods for MDR prediction in the test set. (a) CCMI scores, (b) Hadamard attention weights, (c) IT-SHAPfeature contributions using an RNN without Hadamard attention, and (d) IT-SHAP feature contributions using an RNN with Hadamard attention. Thex-axis represents time steps, and the y-axis corresponds to variables under analysis, with the color scale indicating variable importance at eachtime step.

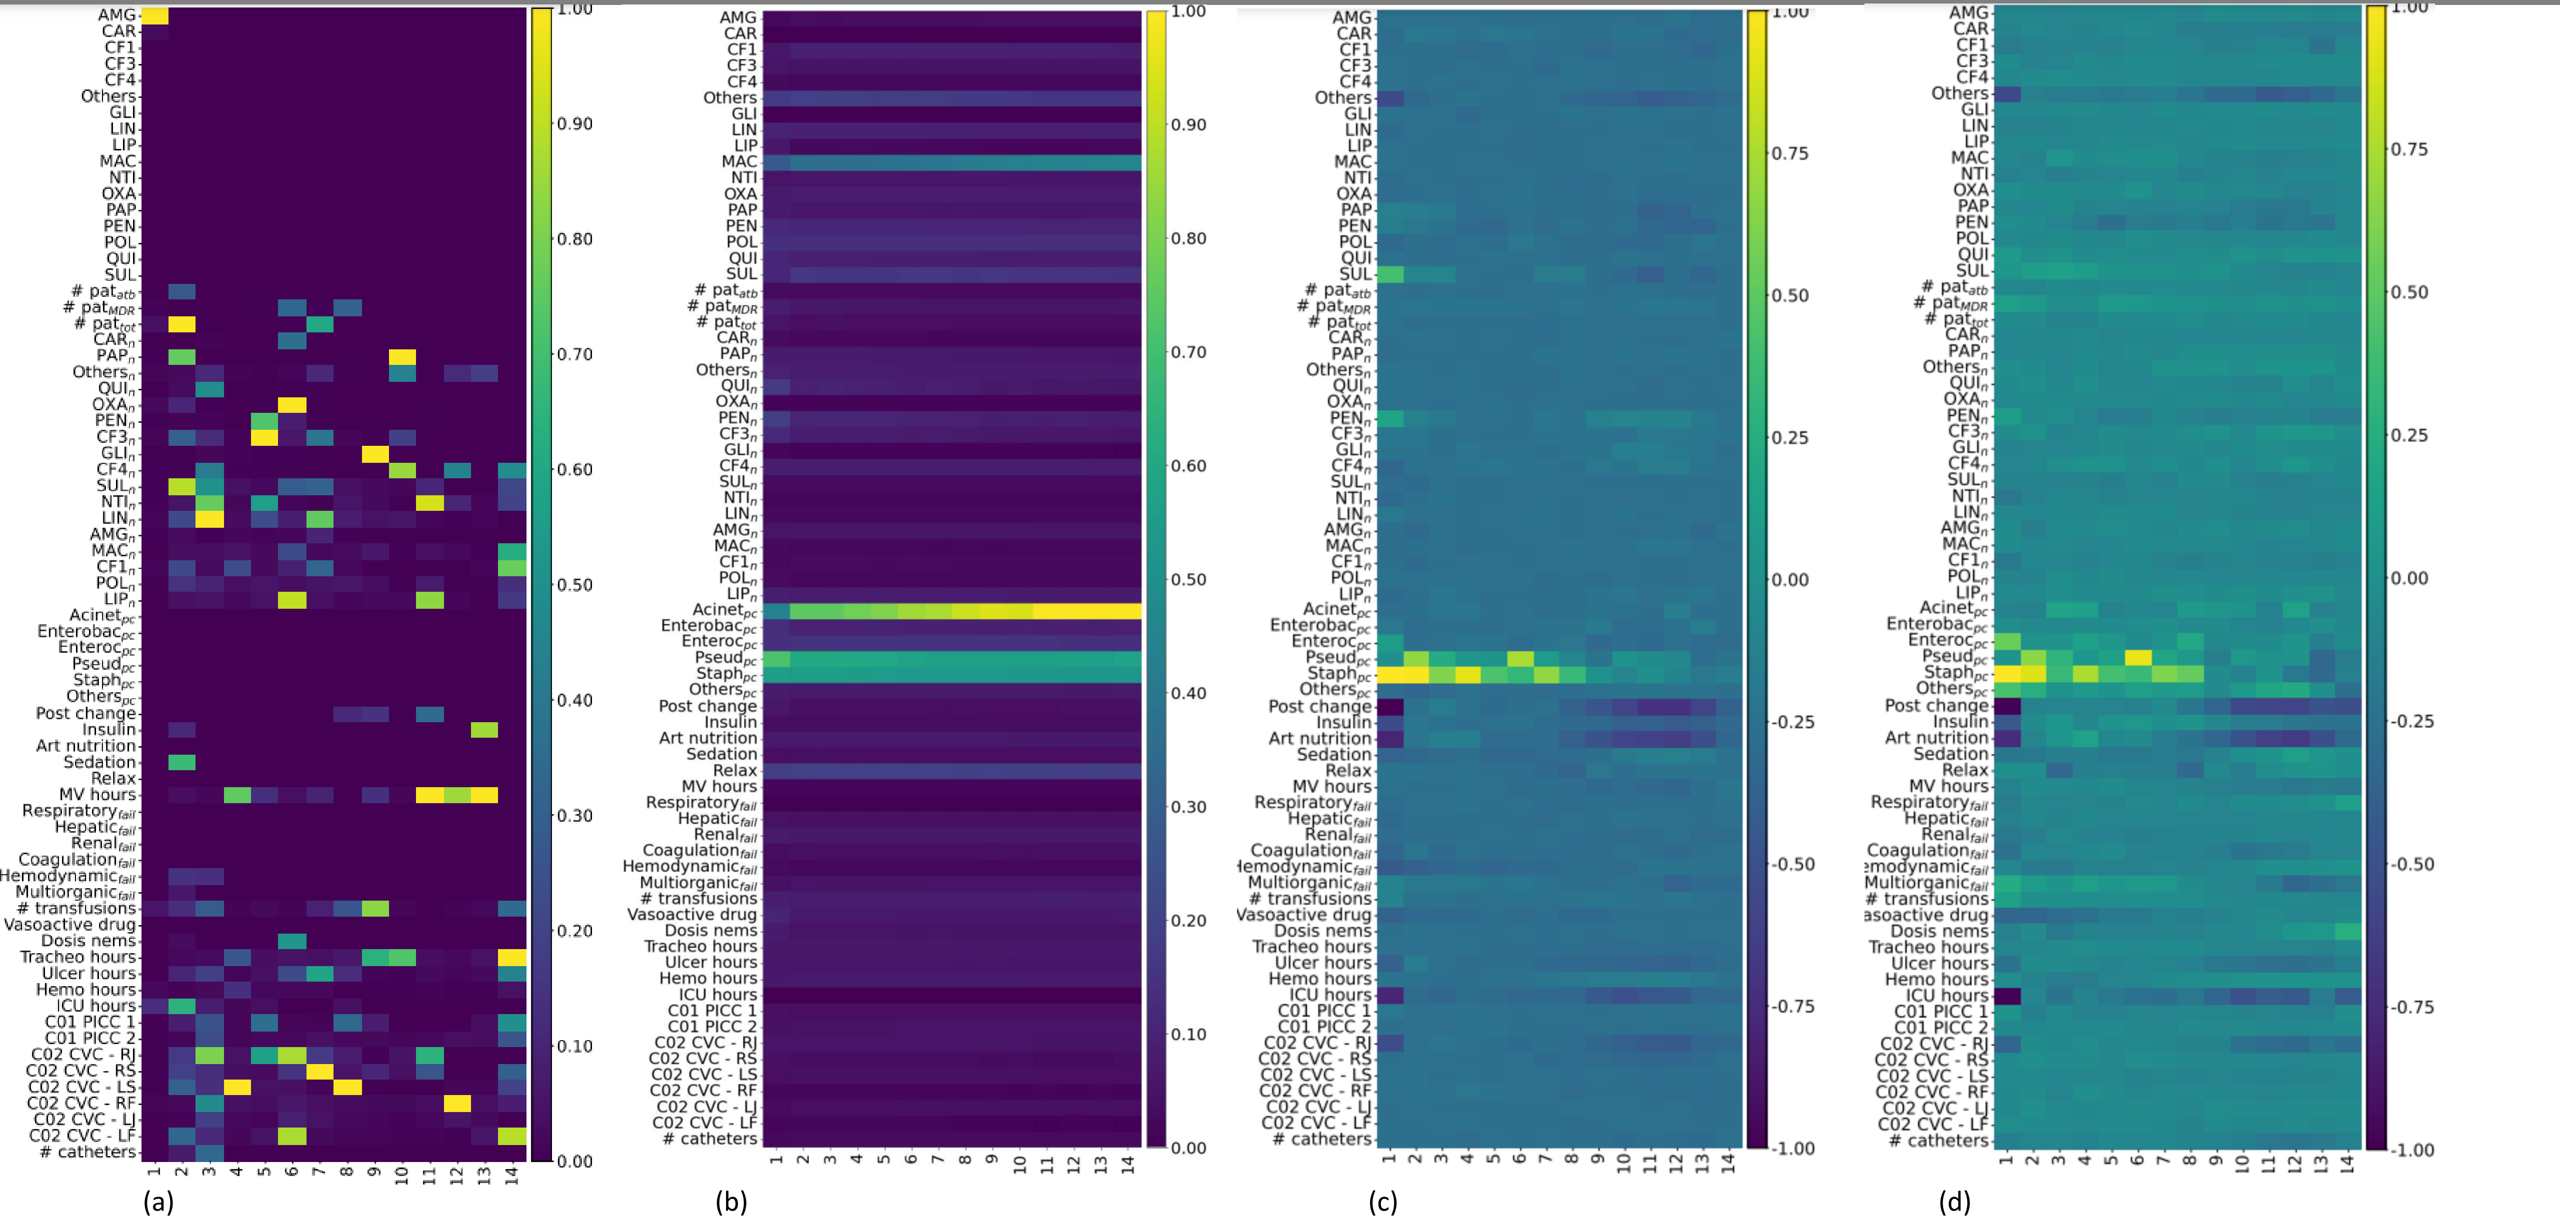
MULTIDRUG RESISTANCE – LSTM (SPLIT 3)



(a) (b) (c) (d)

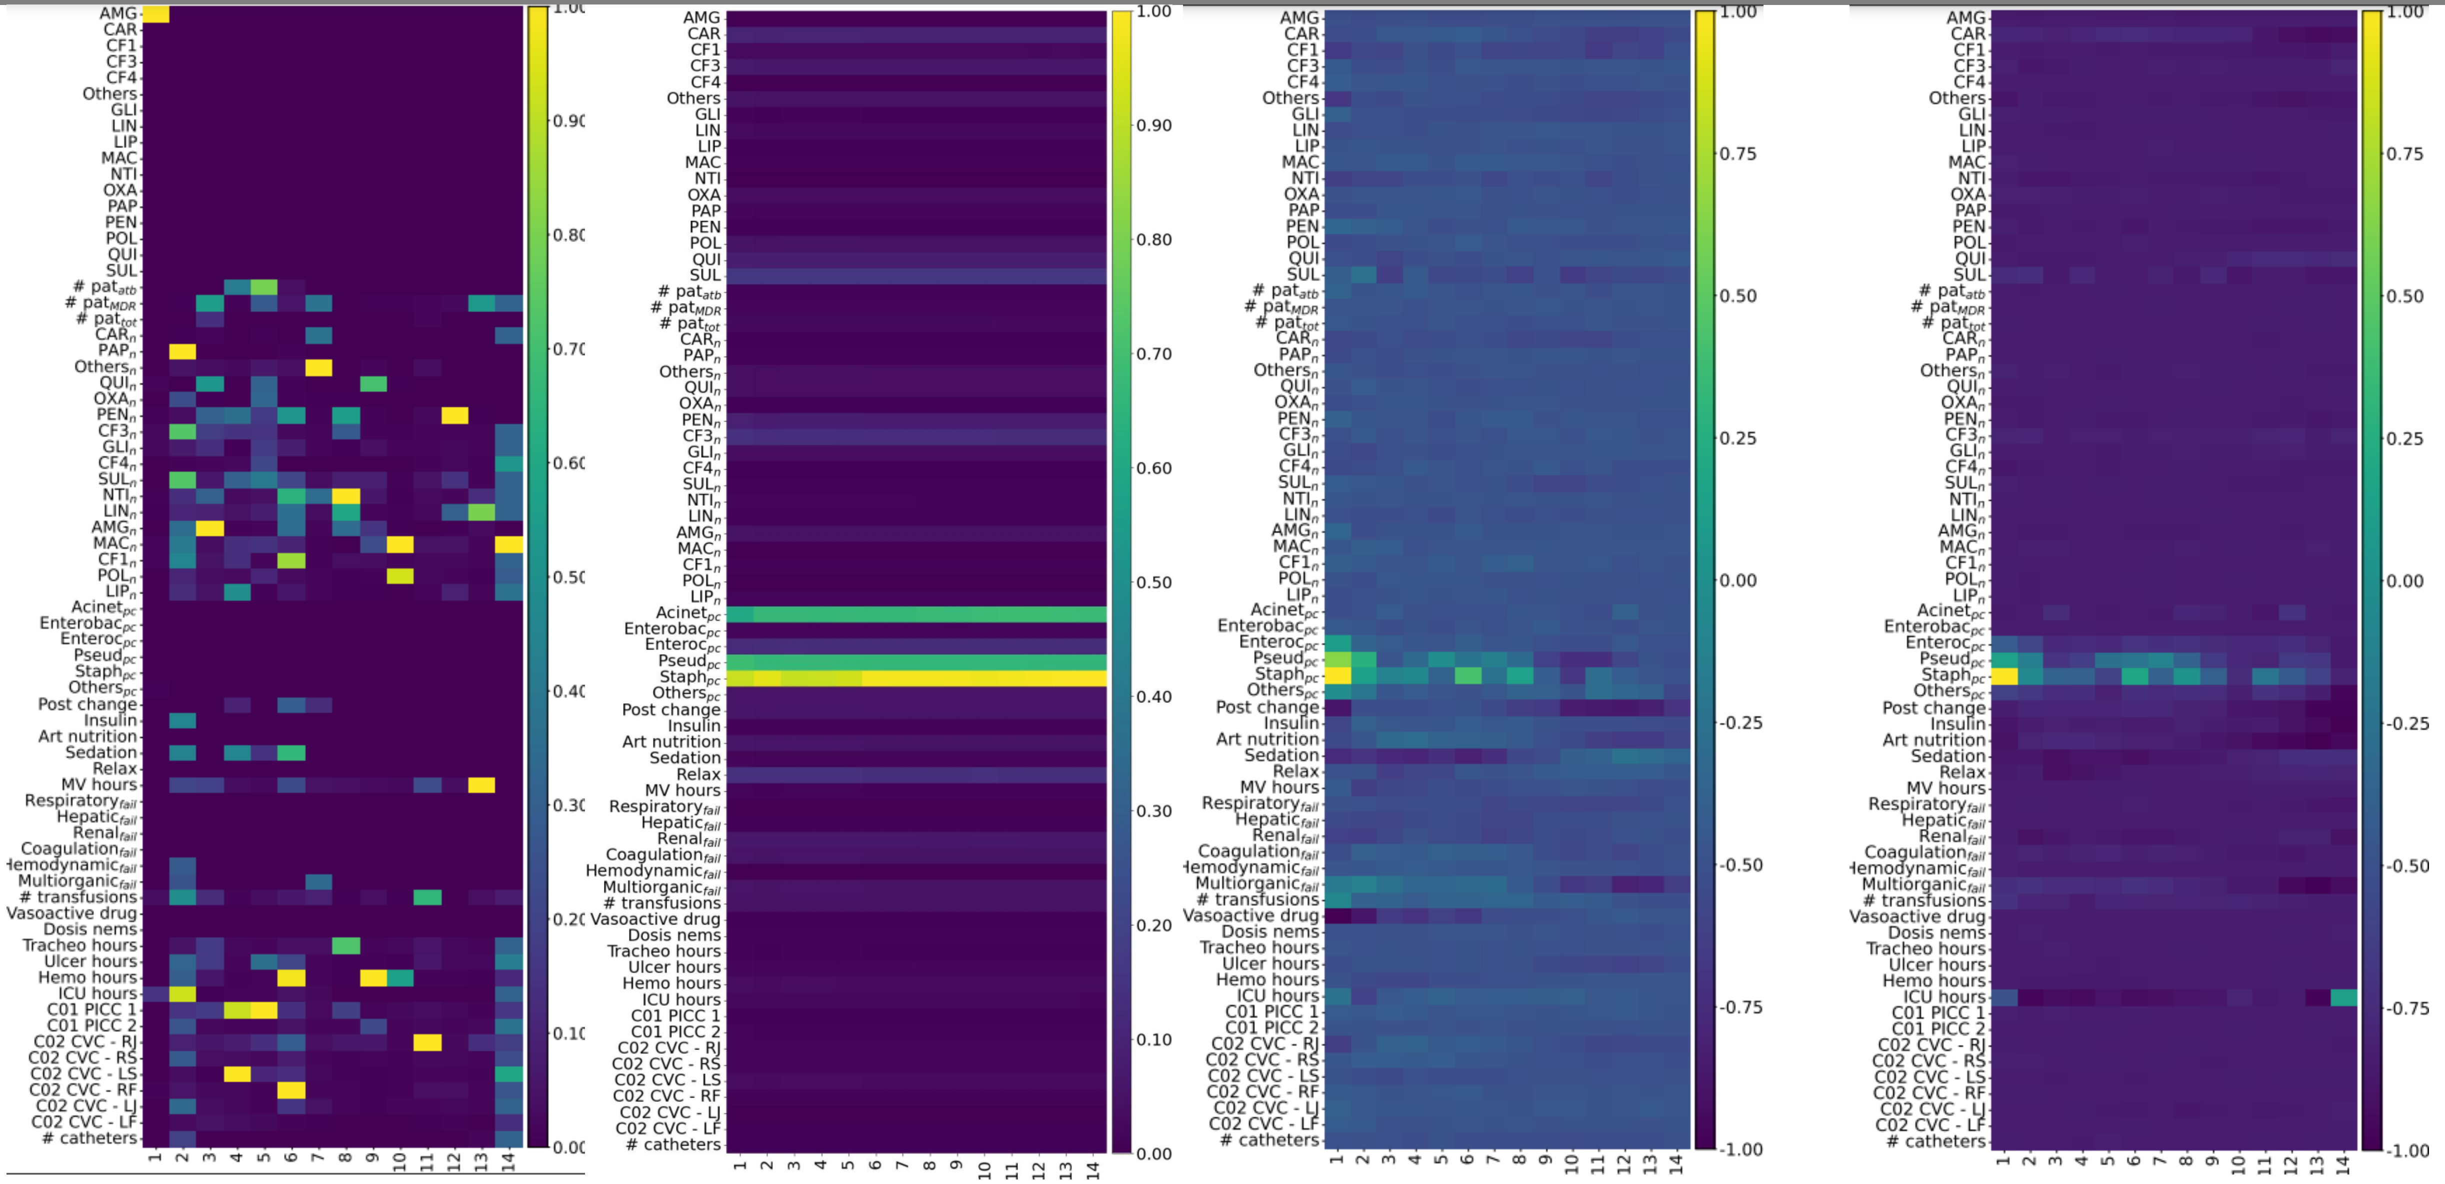
Comparison of explainability methods for MDR prediction in the test set. (a) CCMI scores, (b) Hadamard attention weights, (c) IT-SHAPfeature contributions using an RNN without Hadamard attention, and (d) IT-SHAP feature contributions using an RNN with Hadamard attention. Thex-axis represents time steps, and the y-axis corresponds to variables under analysis, with the color scale indicating variable importance at eachtime step.

MULTIDRUG RESISTANCE – Vanilla RNN (SPLIT 1)



Comparison of explainability methods for MDR prediction in the test set. (a) CCMI scores, (b) Hadamard attention weights, (c) IT-SHAPfeature contributions using an RNN without Hadamard attention, and (d) IT-SHAP feature contributions using an RNN with Hadamard attention. Thex-axis represents time steps, and the y-axis corresponds to variables under analysis, with the color scale indicating variable importance at eachtime step.

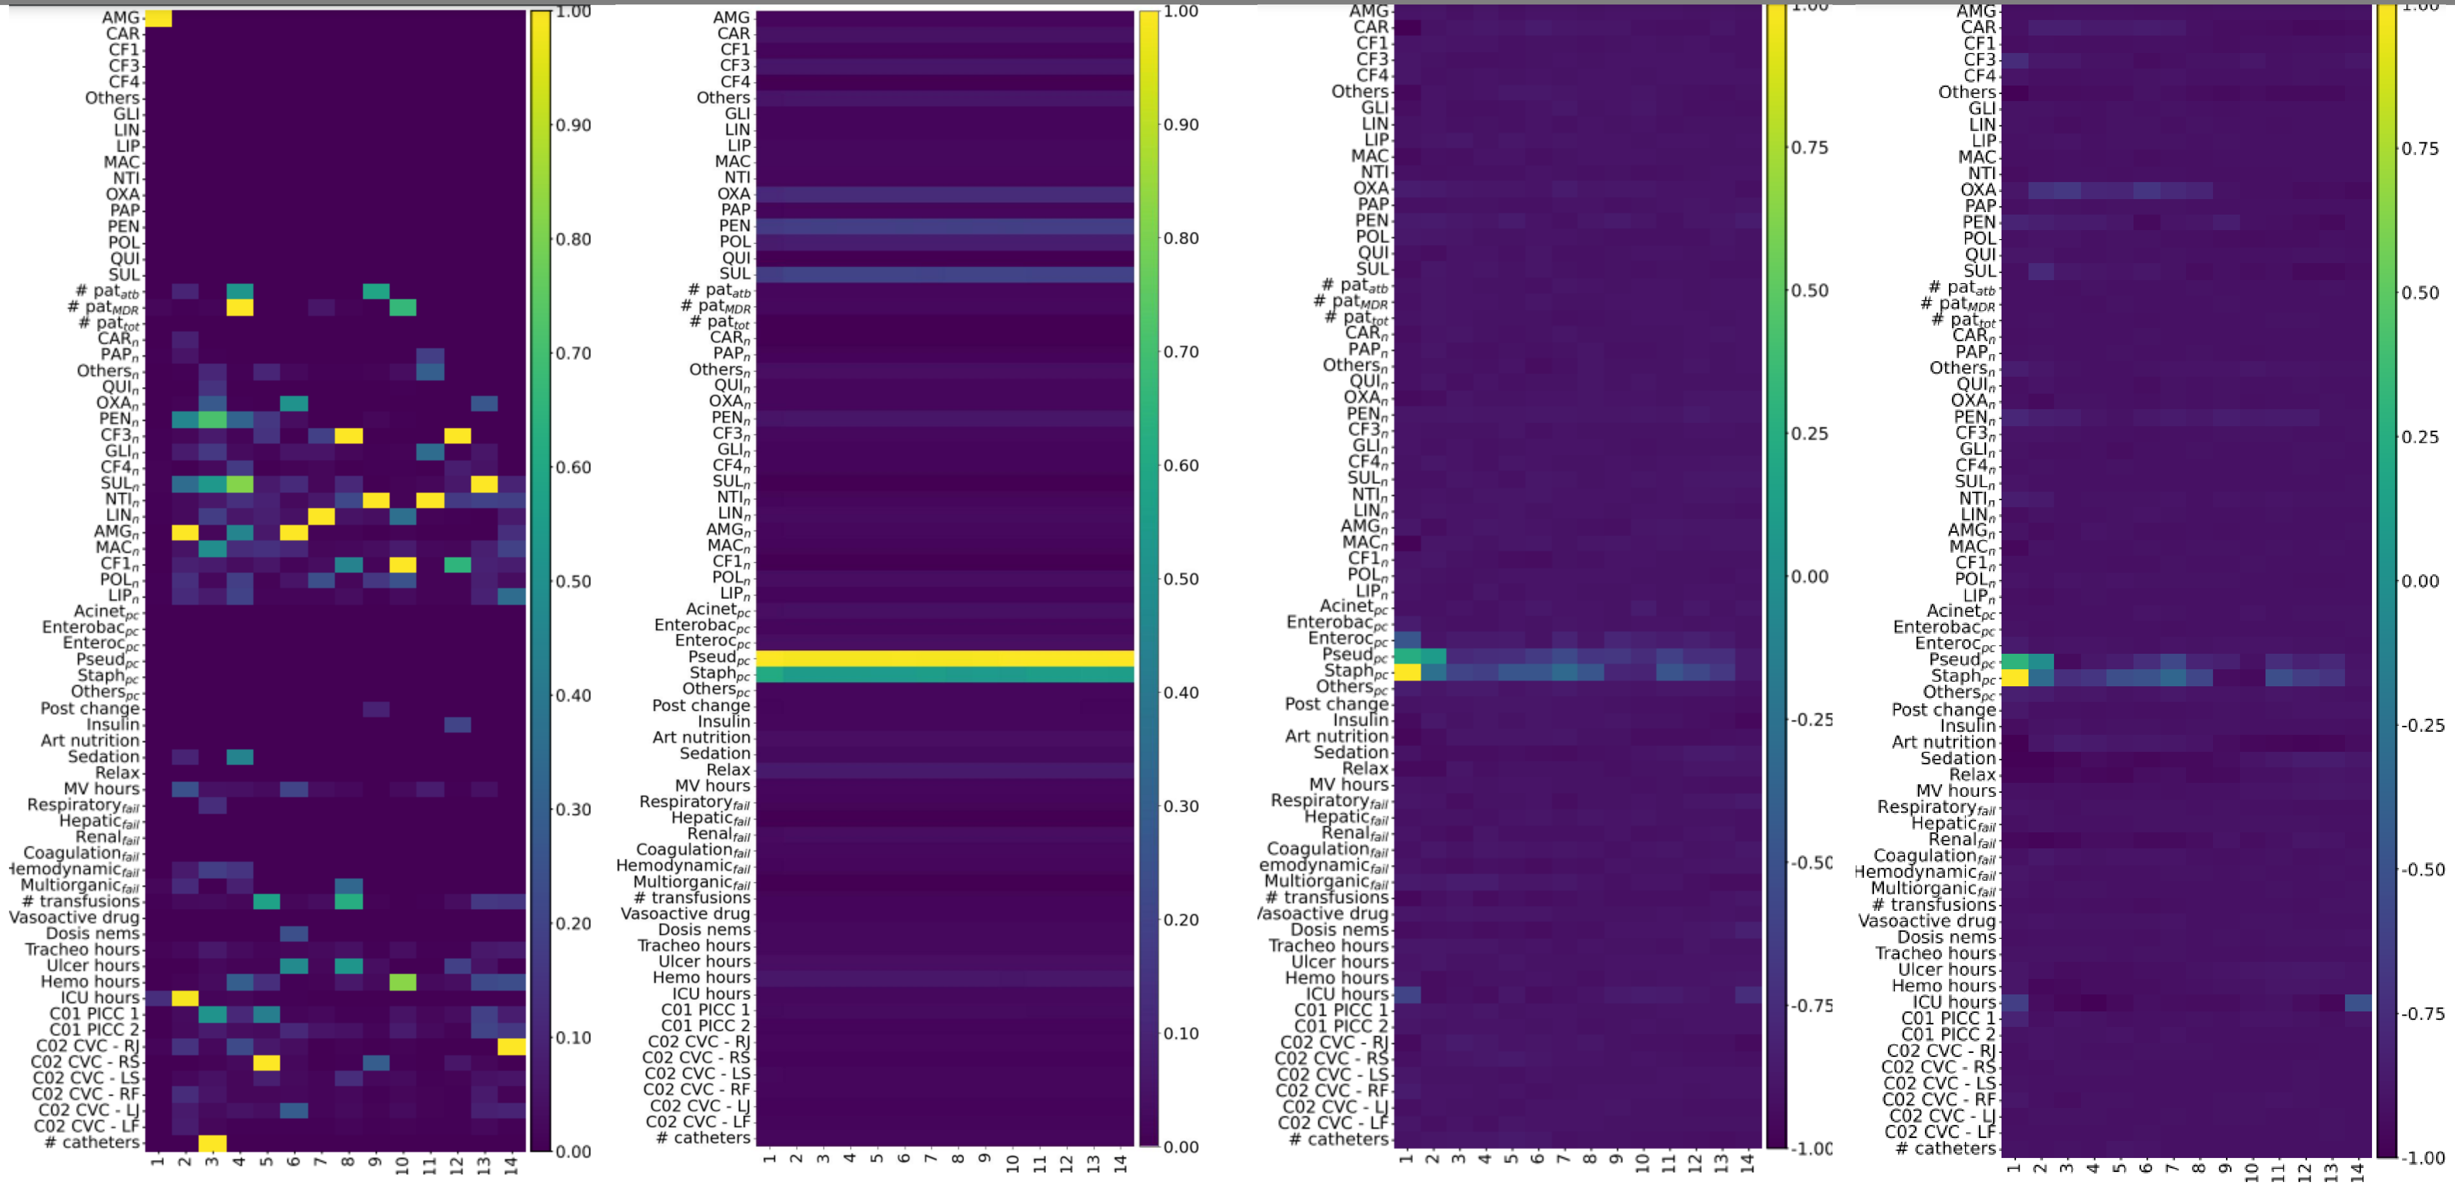
MULTIDRUG RESISTANCE – Vanilla RNN (SPLIT 2)



(a) (b) (c) (d)

Comparison of explainability methods for MDR prediction in the test set. (a) CCMI scores, (b) Hadamard attention weights, (c) IT-SHAPfeature contributions using an RNN without Hadamard attention, and (d) IT-SHAP feature contributions using an RNN with Hadamard attention. Thex-axis represents time steps, and the y-axis corresponds to variables under analysis, with the color scale indicating variable importance at eachtime step.

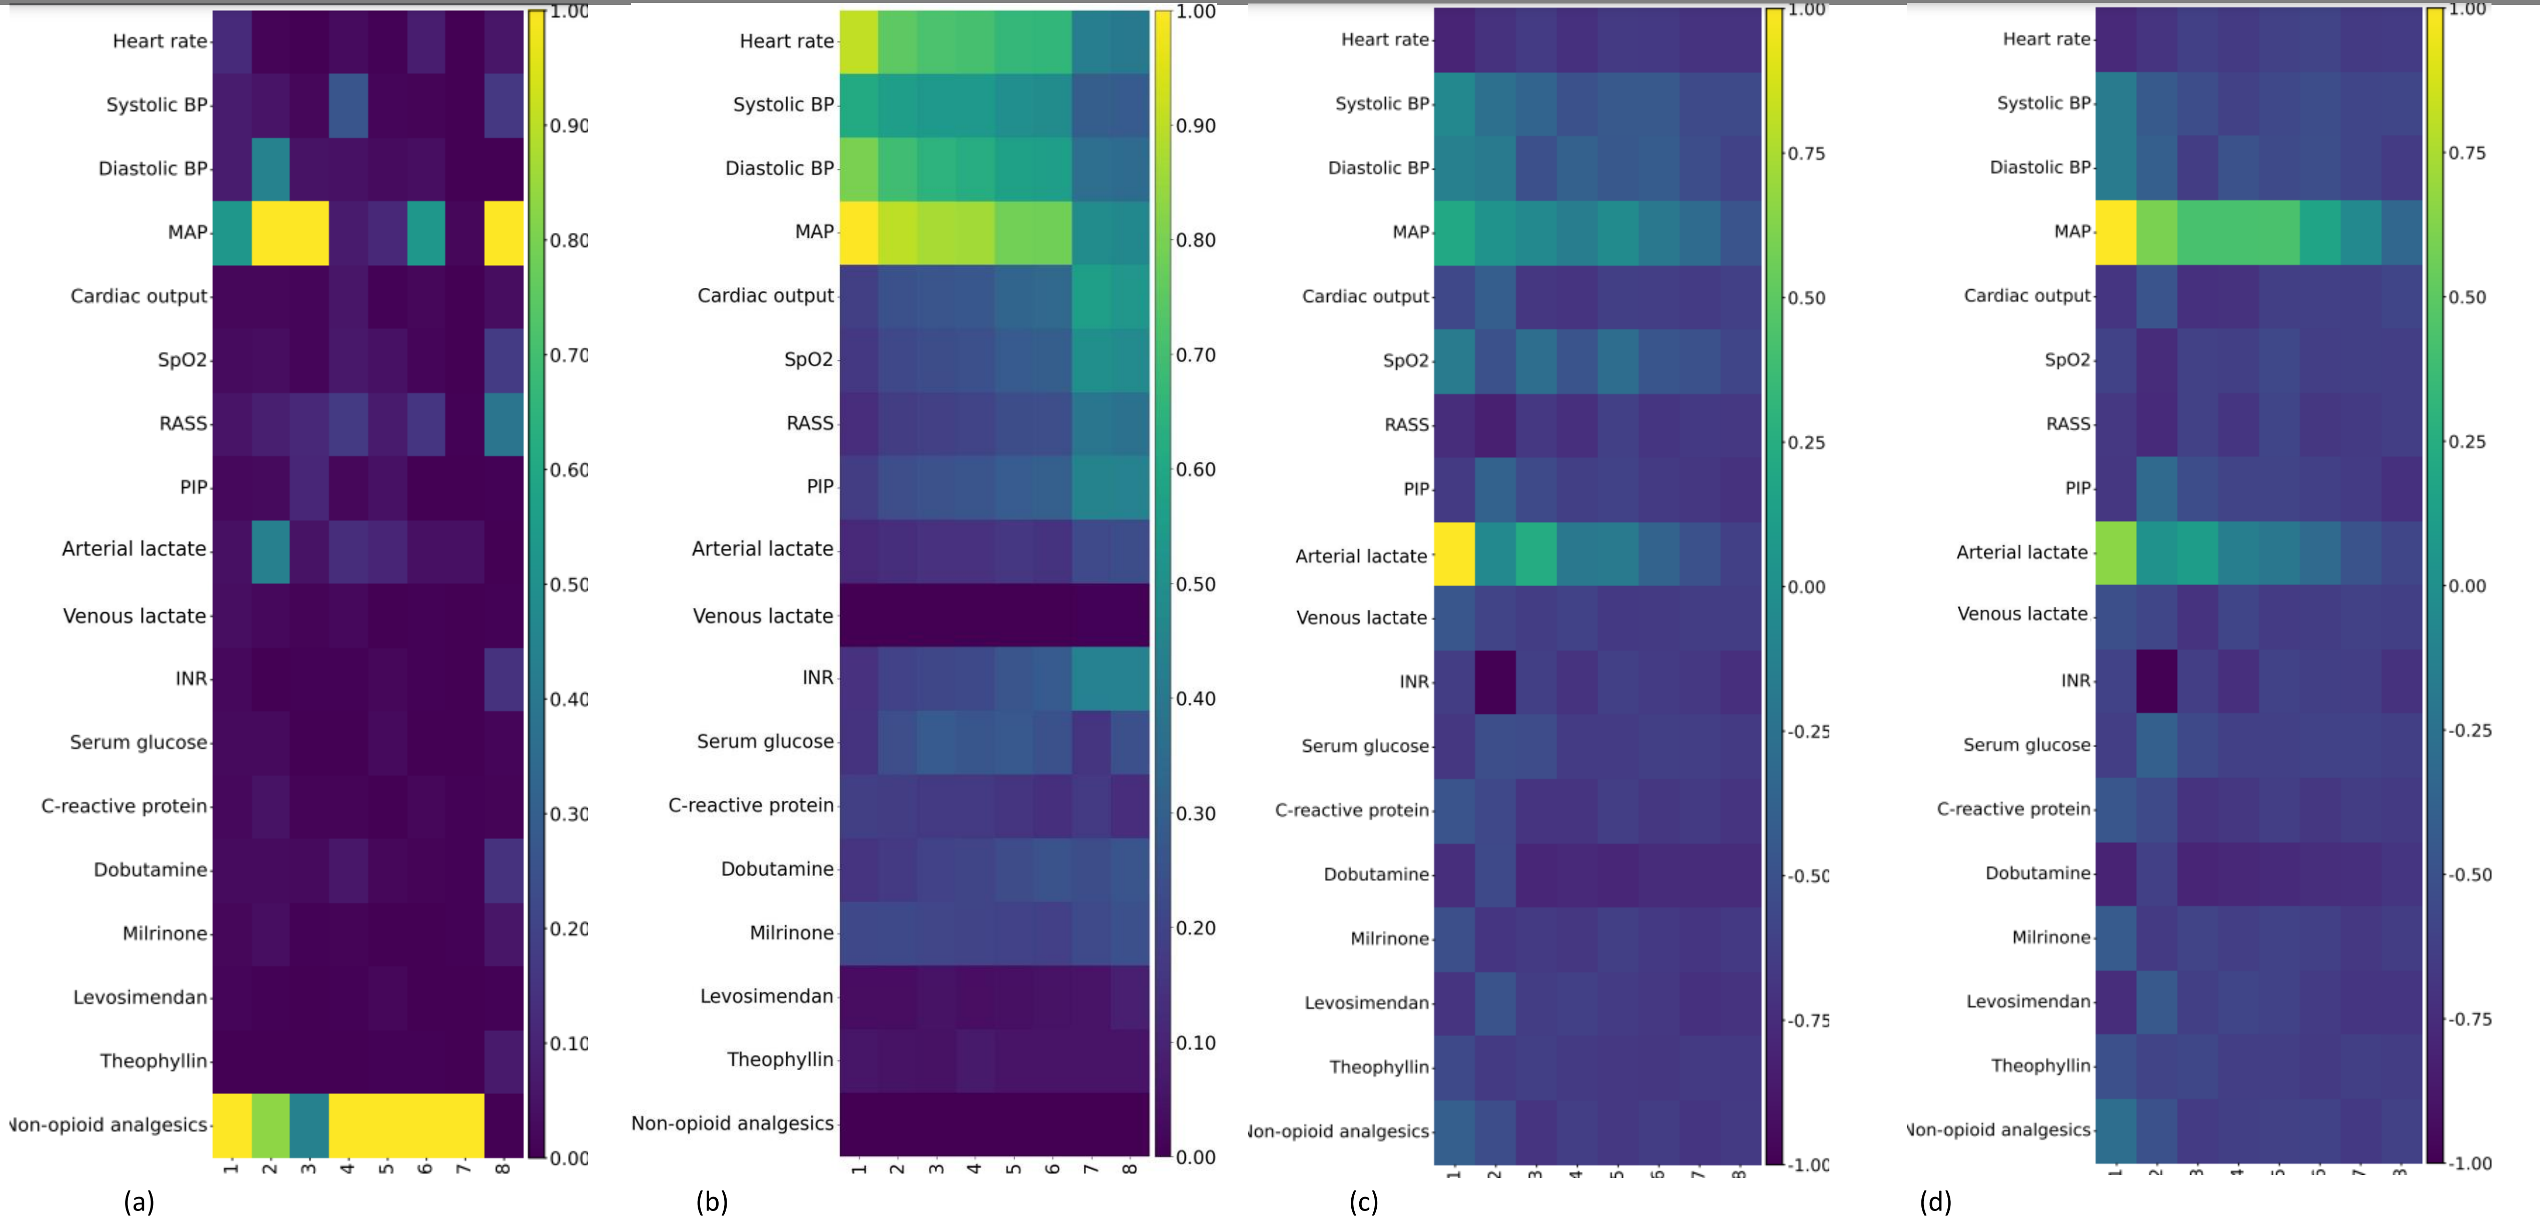
MULTIDRUG RESISTANCE – Vanilla RNN (SPLIT 3)



(a) (b) (c) (d)

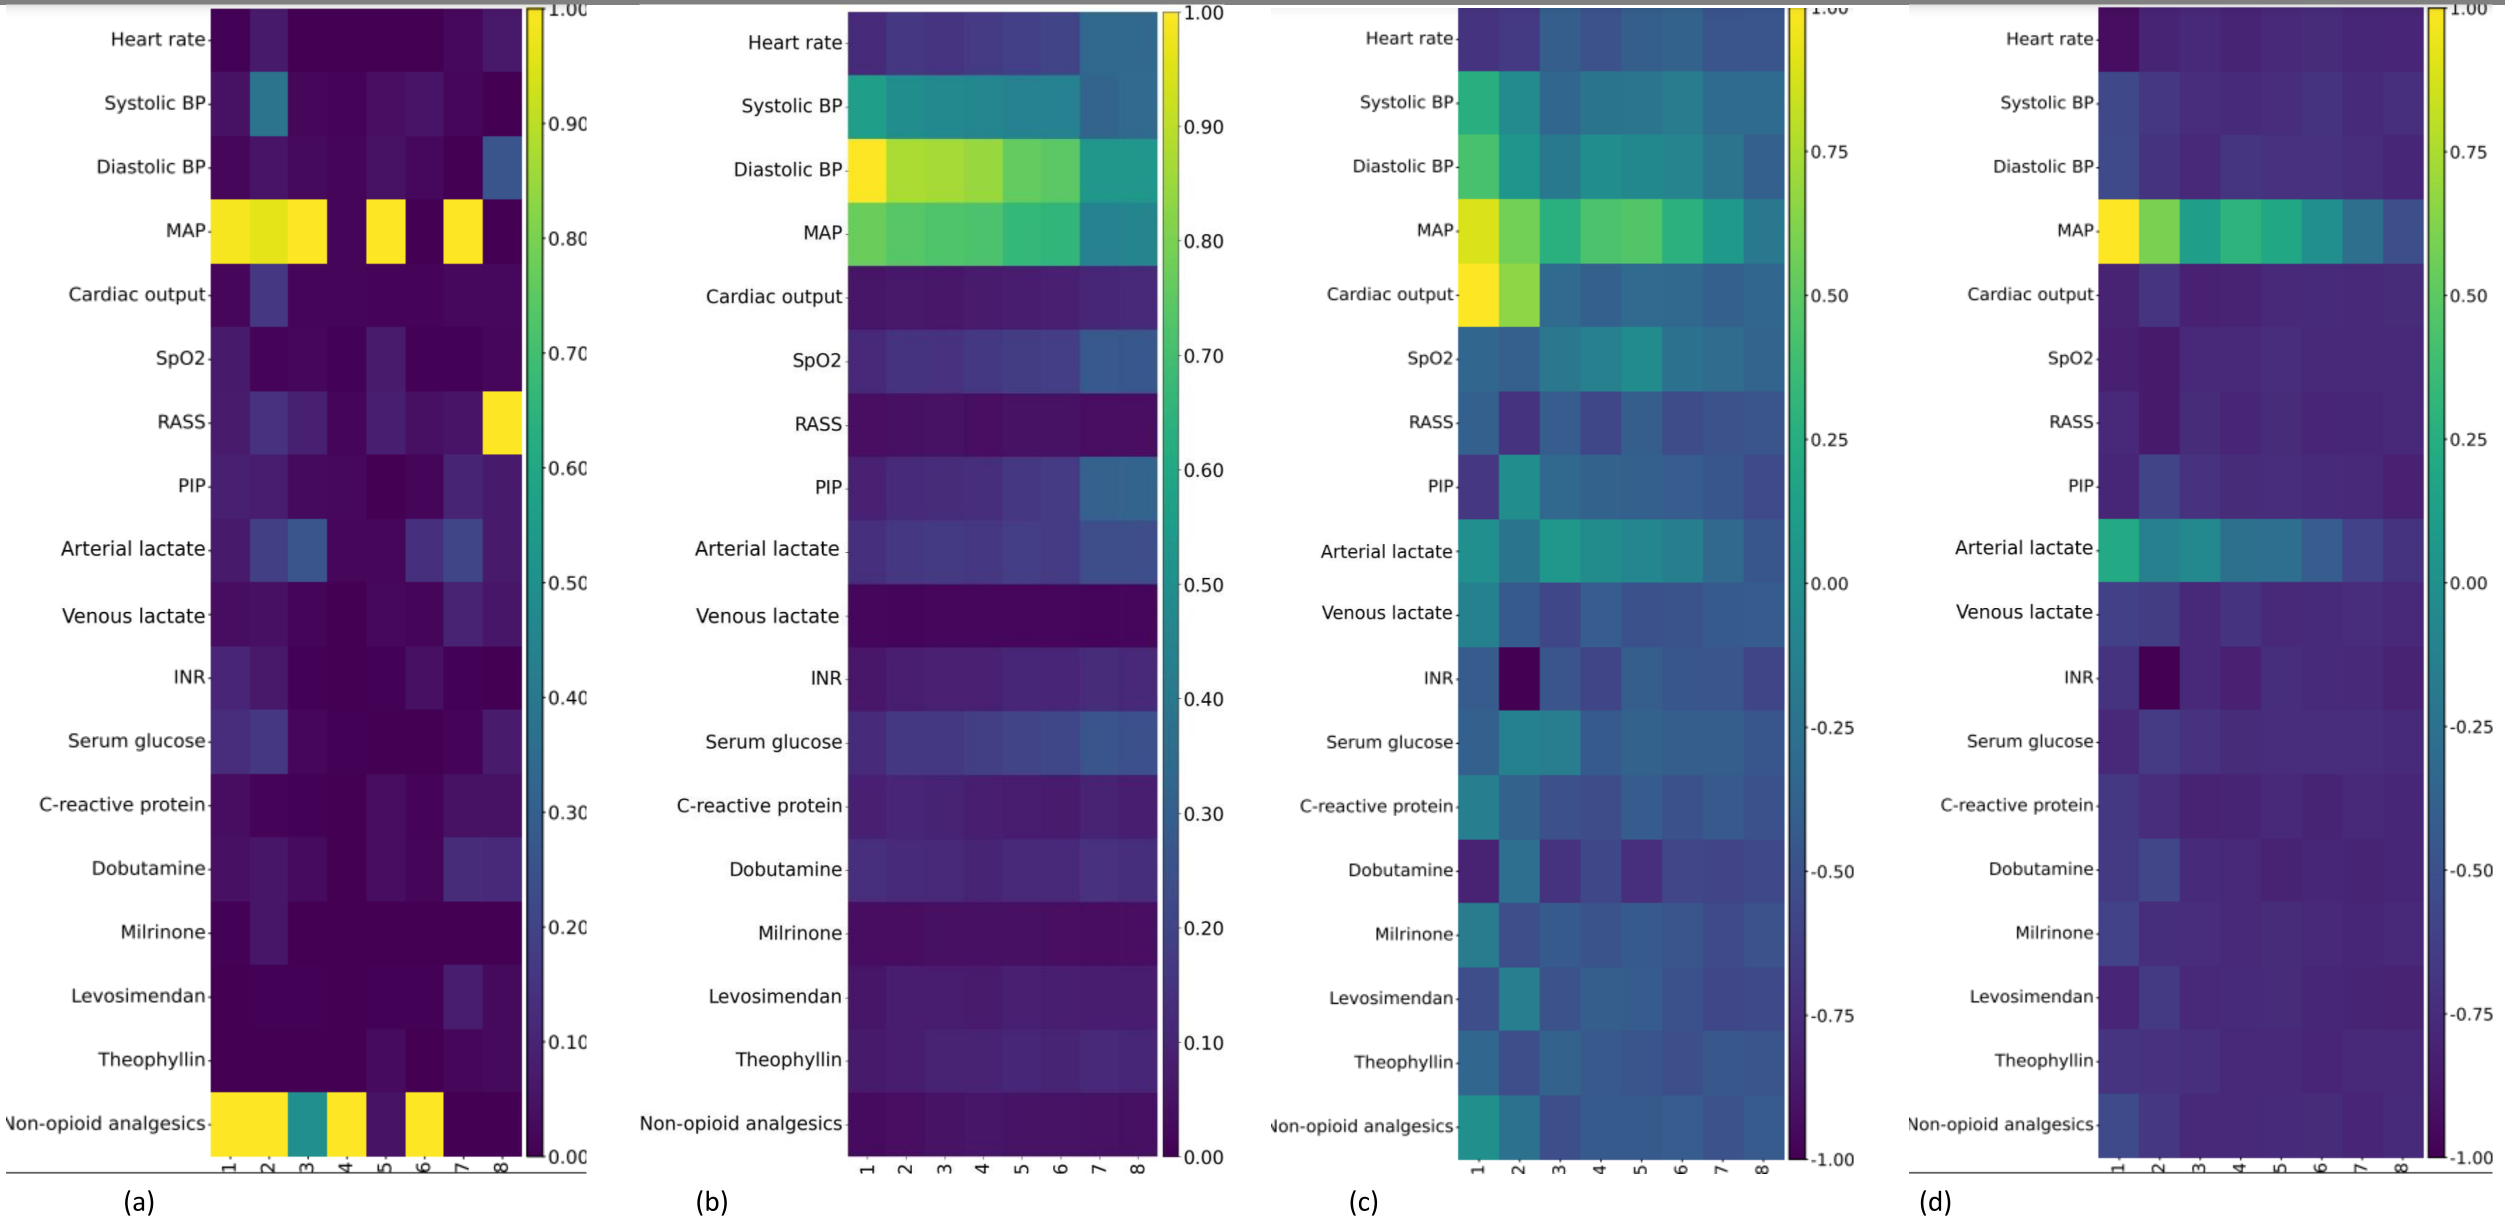
Comparison of explainability methods for MDR prediction in the test set. (a) CCMI scores, (b) Hadamard attention weights, (c) IT-SHAPfeature contributions using an RNN without Hadamard attention, and (d) IT-SHAP feature contributions using an RNN with Hadamard attention. Thex-axis represents time steps, and the y-axis corresponds to variables under analysis, with the color scale indicating variable importance at eachtime step.

CIRCULATORY FAILURE– GRU (SPLIT 1)



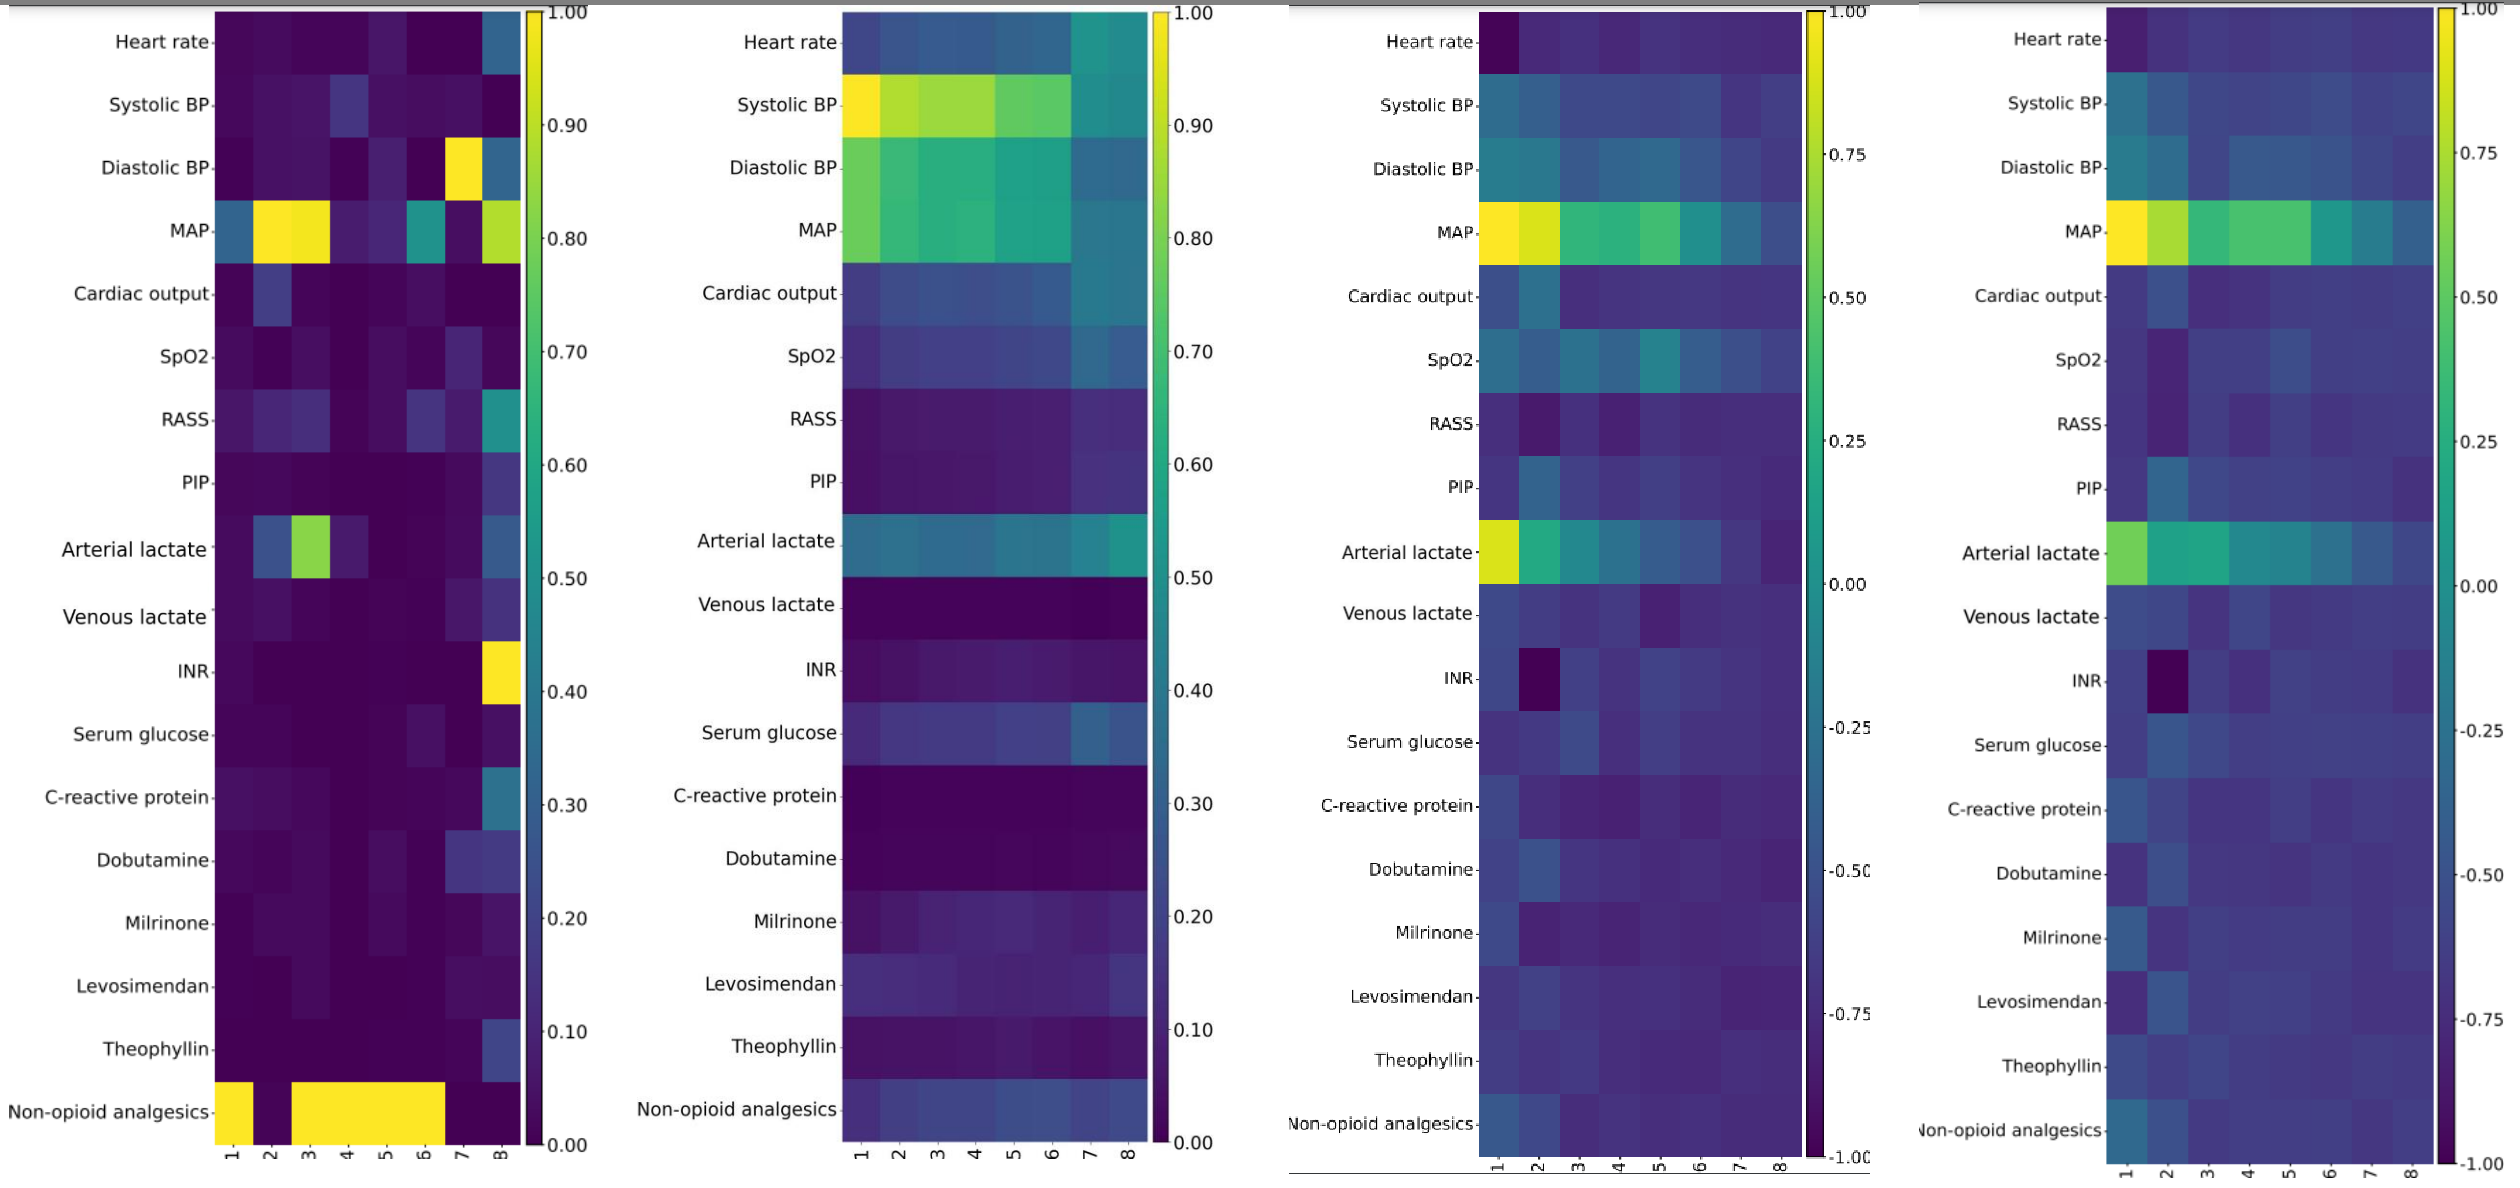
Comparison of explainability methods for MDR prediction in the test set. (a) CCMI scores, (b) Hadamard attention weights, (c) IT-SHAPfeature contributions using an RNN without Hadamard attention, and (d) IT-SHAP feature contributions using an RNN with Hadamard attention. Thex-axis represents time steps, and the y-axis corresponds to variables under analysis, with the color scale indicating variable importance at eachtime step.

CIRCULATORY FAILURE – GRU (SPLIT 2)



Comparison of explainability methods for MDR prediction in the test set. (a) CCMI scores, (b) Hadamard attention weights, (c) IT-SHAPfeature contributions using an RNN without Hadamard attention, and (d) IT-SHAP feature contributions using an RNN with Hadamard attention. Thex-axis represents time steps, and the y-axis corresponds to variables under analysis, with the color scale indicating variable importance at eachtime step.

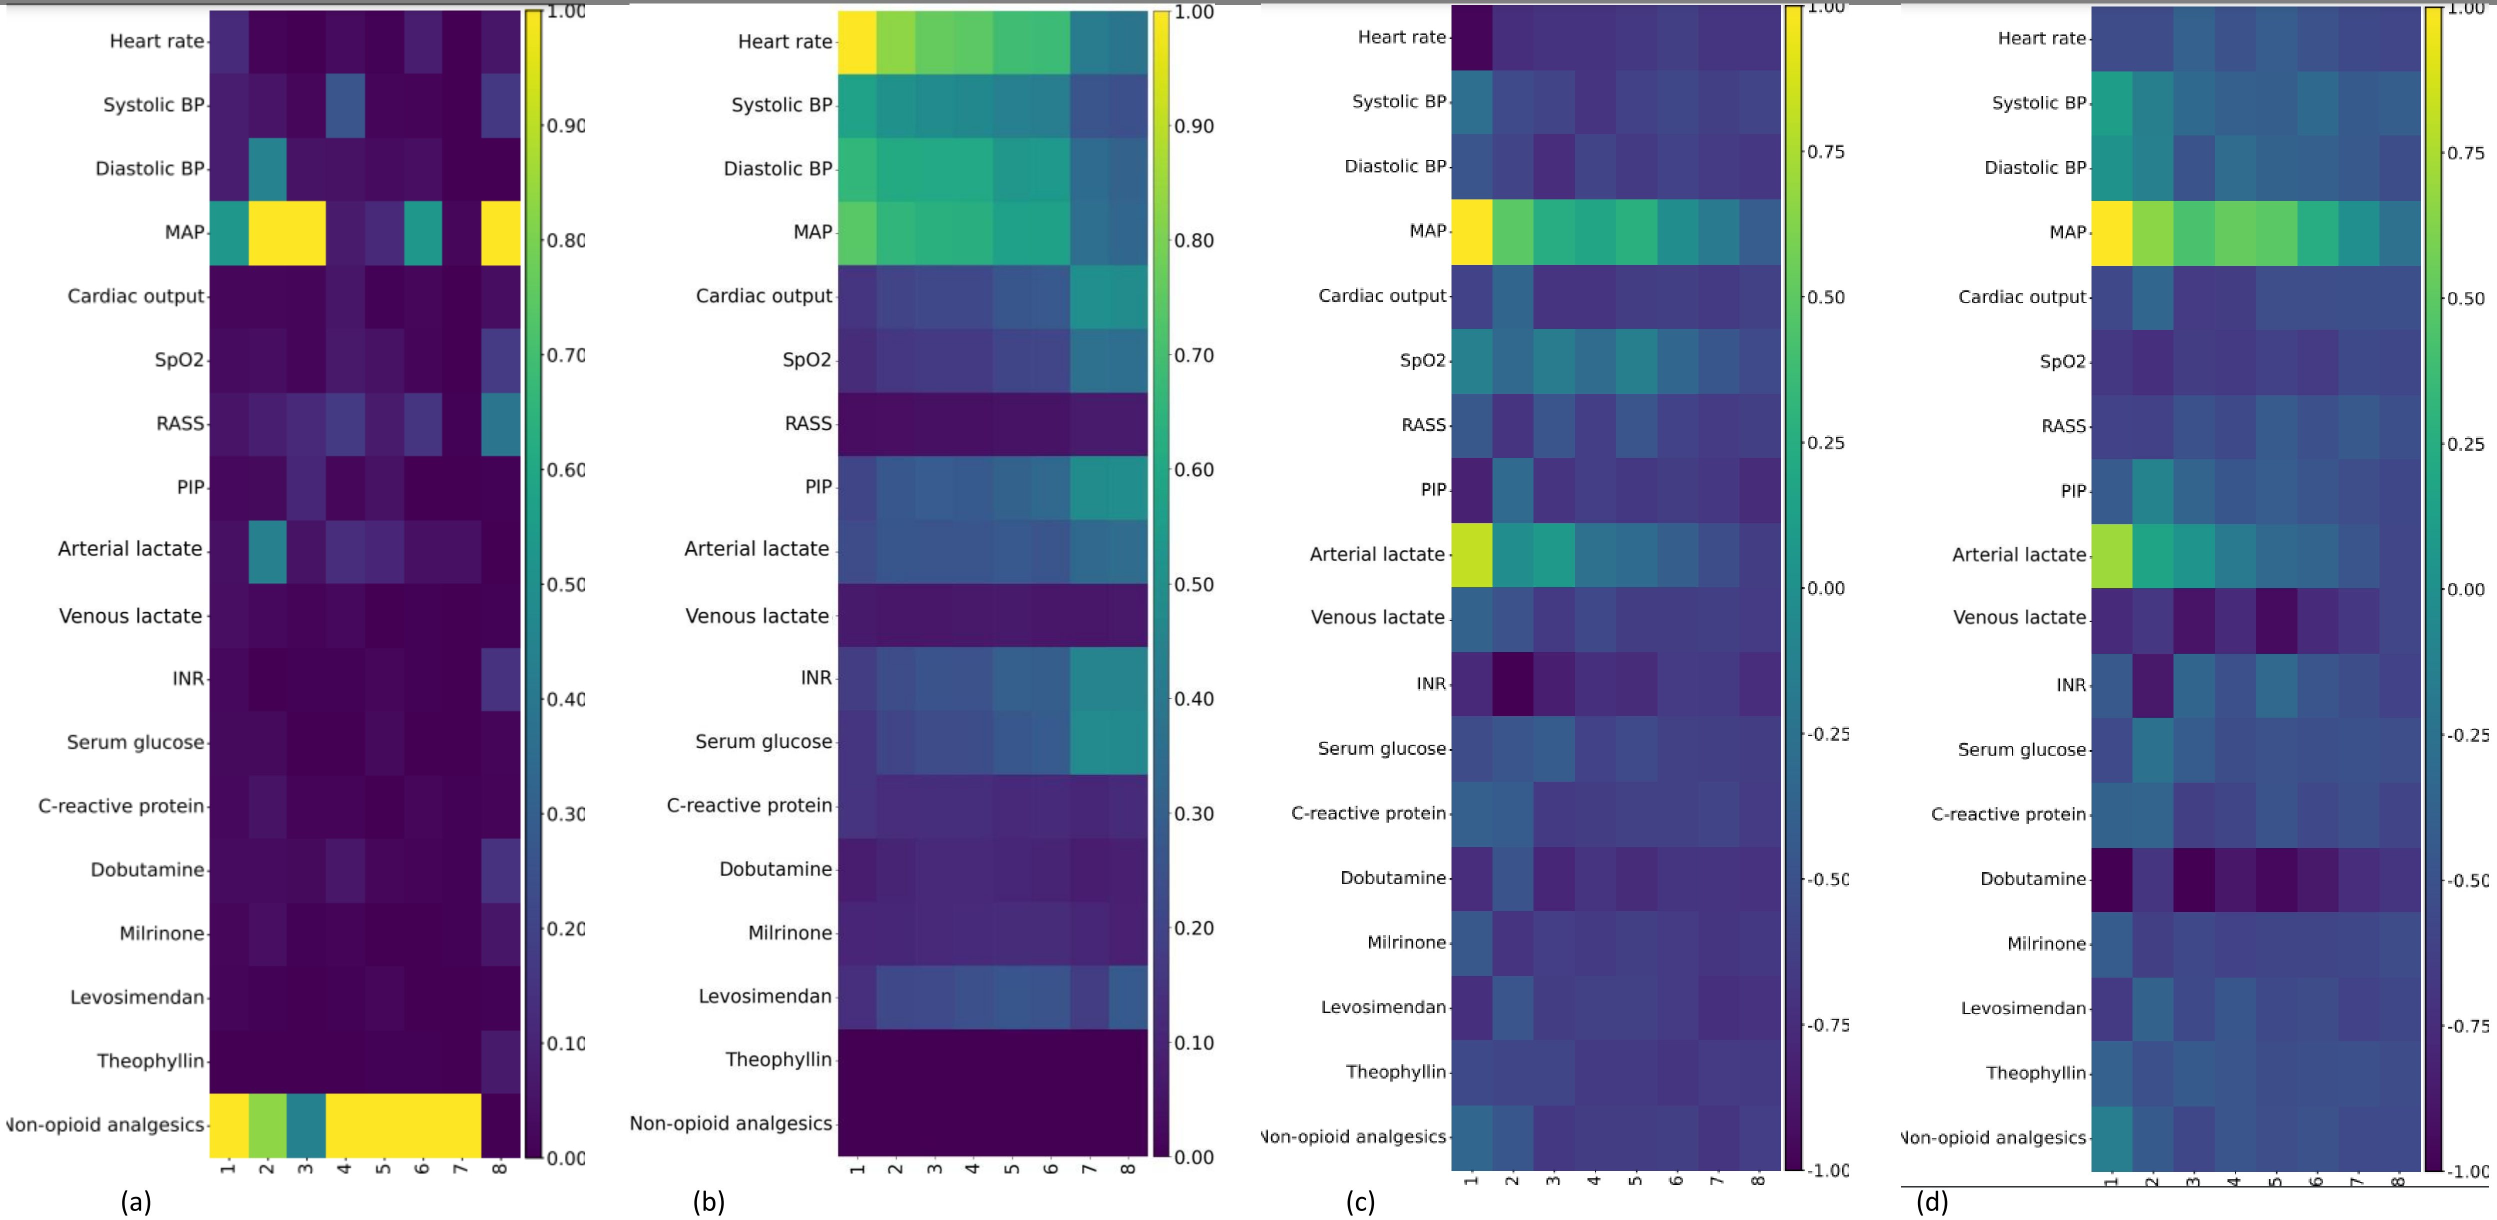
CIRCULATORY FAILURE – GRU (SPLIT 3)



(a) (b) (c) (d)

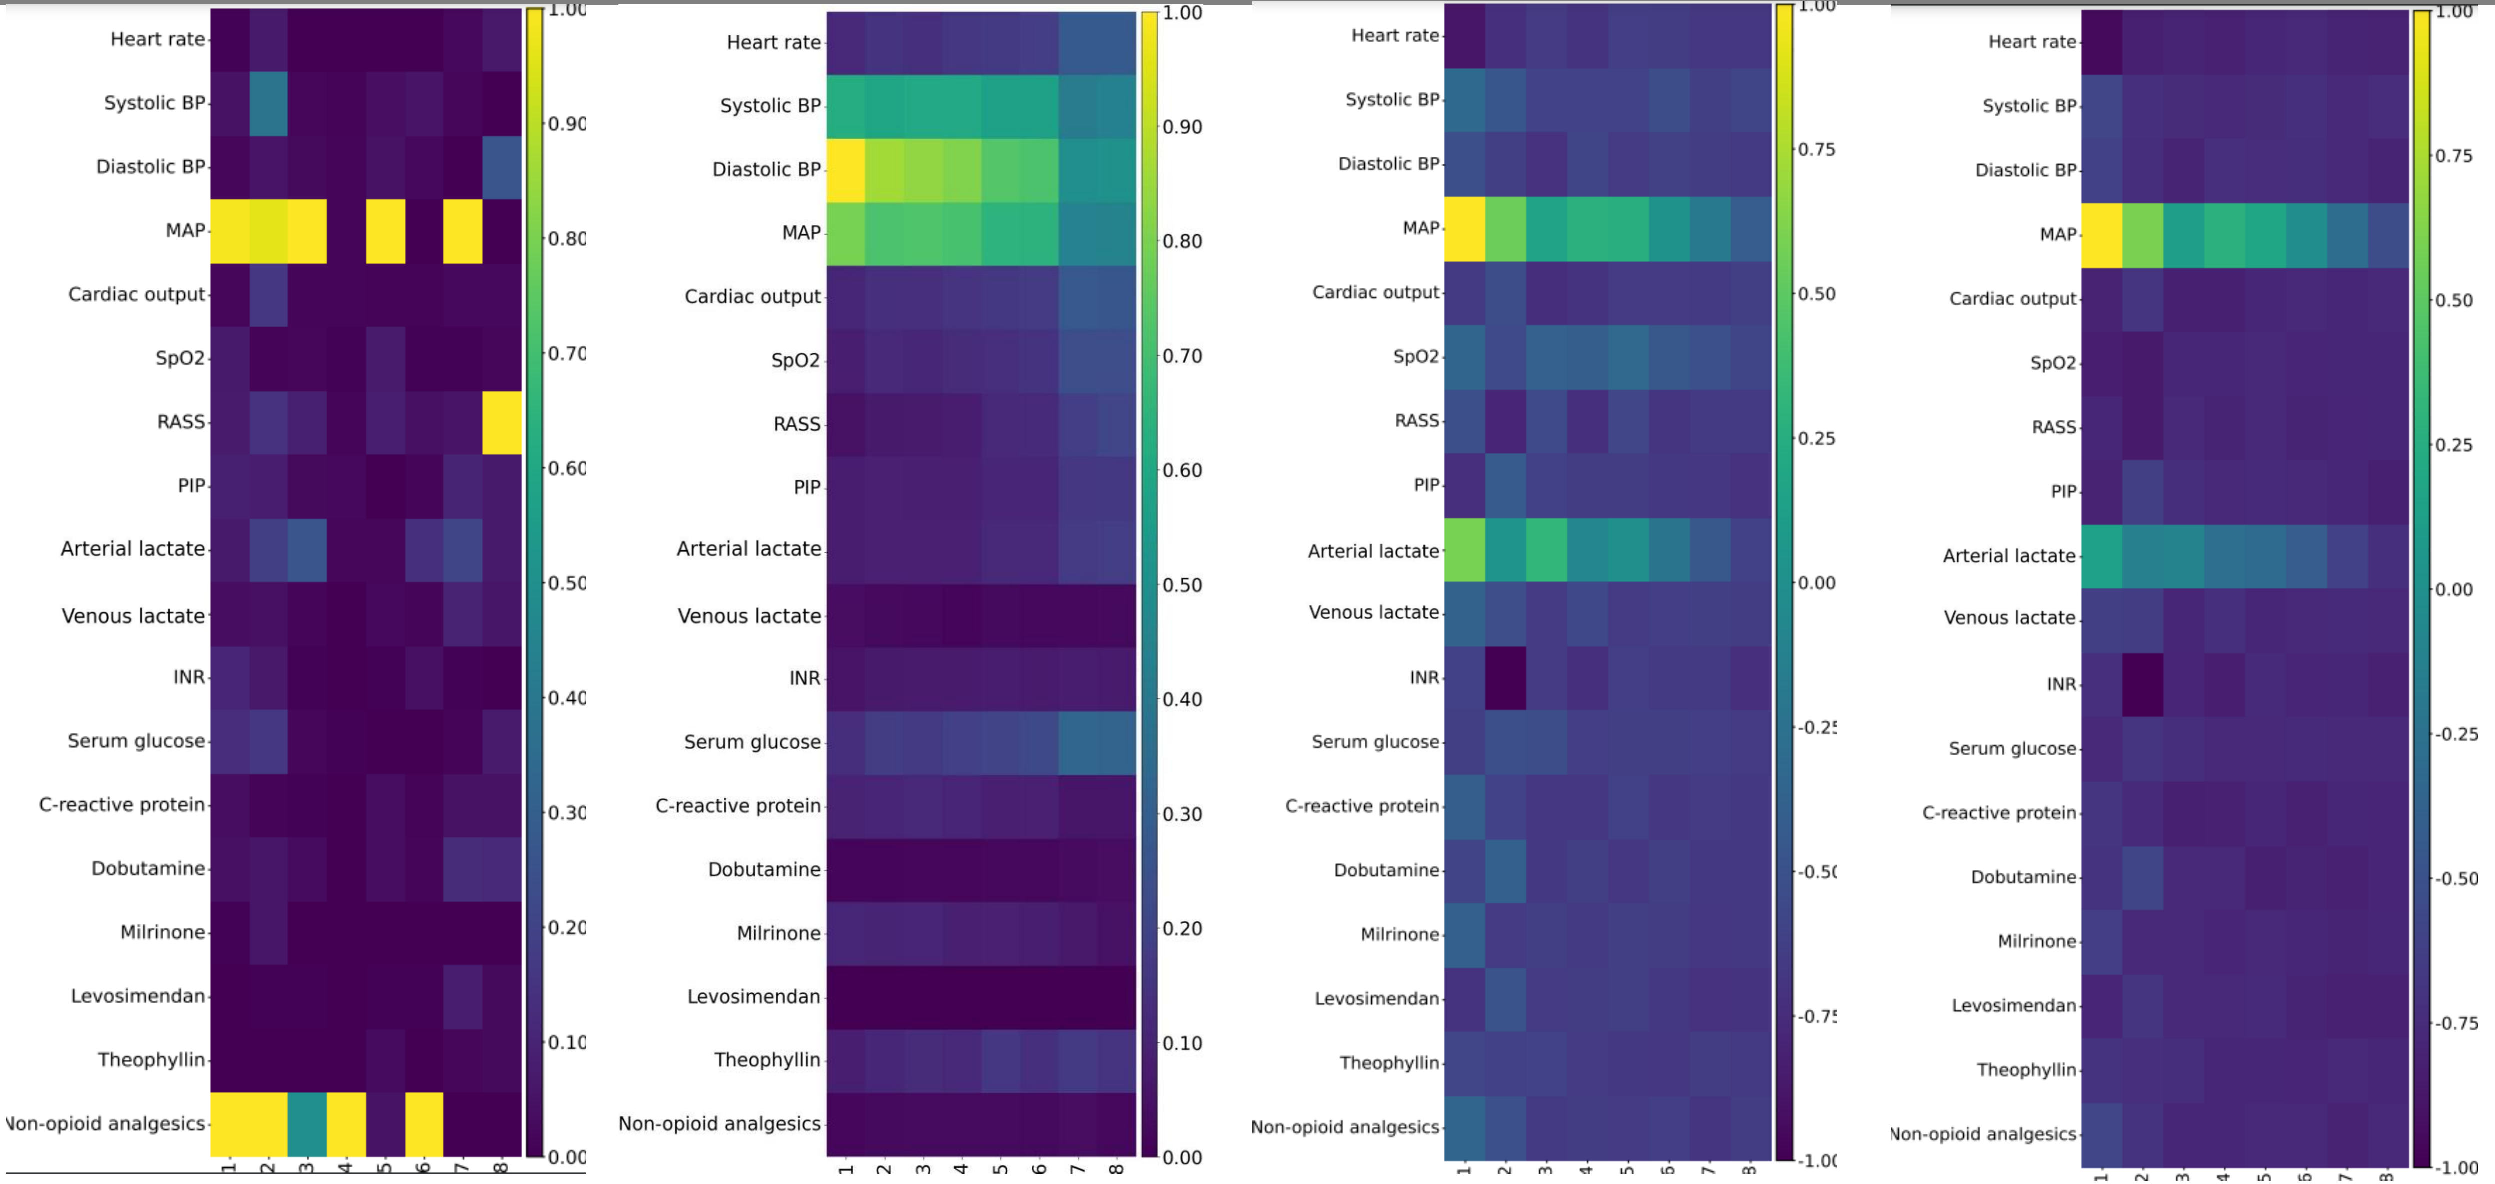
Comparison of explainability methods for MDR prediction in the test set. (a) CCMI scores, (b) Hadamard attention weights, (c) IT-SHAPfeature contributions using an RNN without Hadamard attention, and (d) IT-SHAP feature contributions using an RNN with Hadamard attention. Thex-axis represents time steps, and the y-axis corresponds to variables under analysis, with the color scale indicating variable importance at eachtime step.

CIRCULATORY FAILURE – LSTM (SPLIT 1)



Comparison of explainability methods for MDR prediction in the test set. (a) CCMI scores, (b) Hadamard attention weights, (c) IT-SHAPfeature contributions using an RNN without Hadamard attention, and (d) IT-SHAP feature contributions using an RNN with Hadamard attention. Thex-axis represents time steps, and the y-axis corresponds to variables under analysis, with the color scale indicating variable importance at eachtime step.

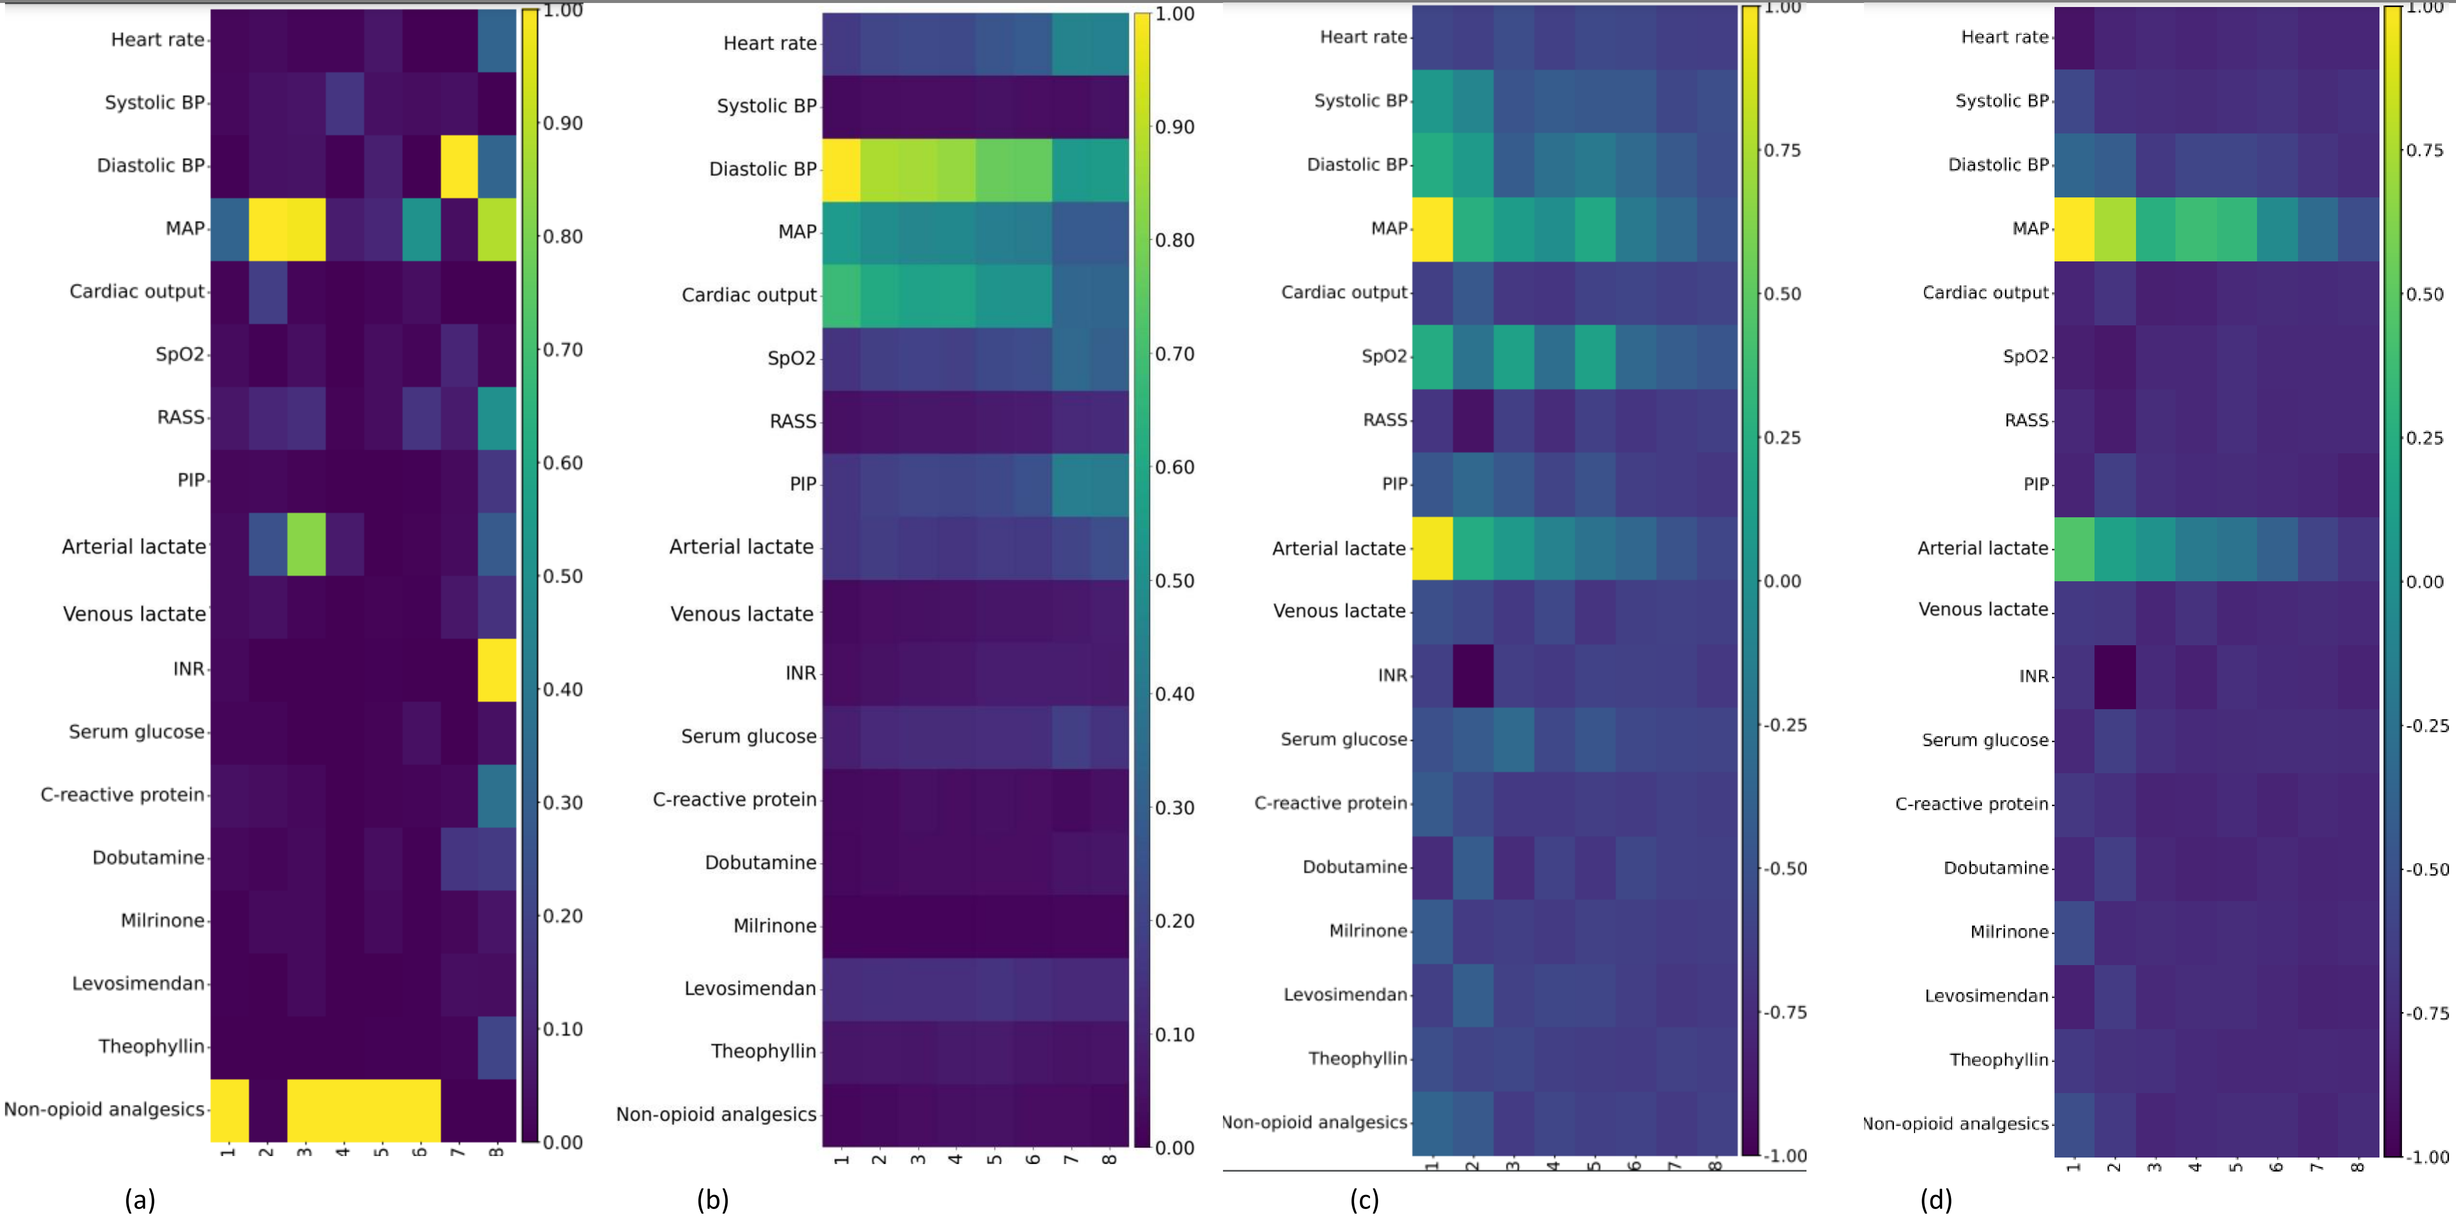
CIRCULATORY FAILURE – LSTM (SPLIT 2)



(a) (b) (c) (d)

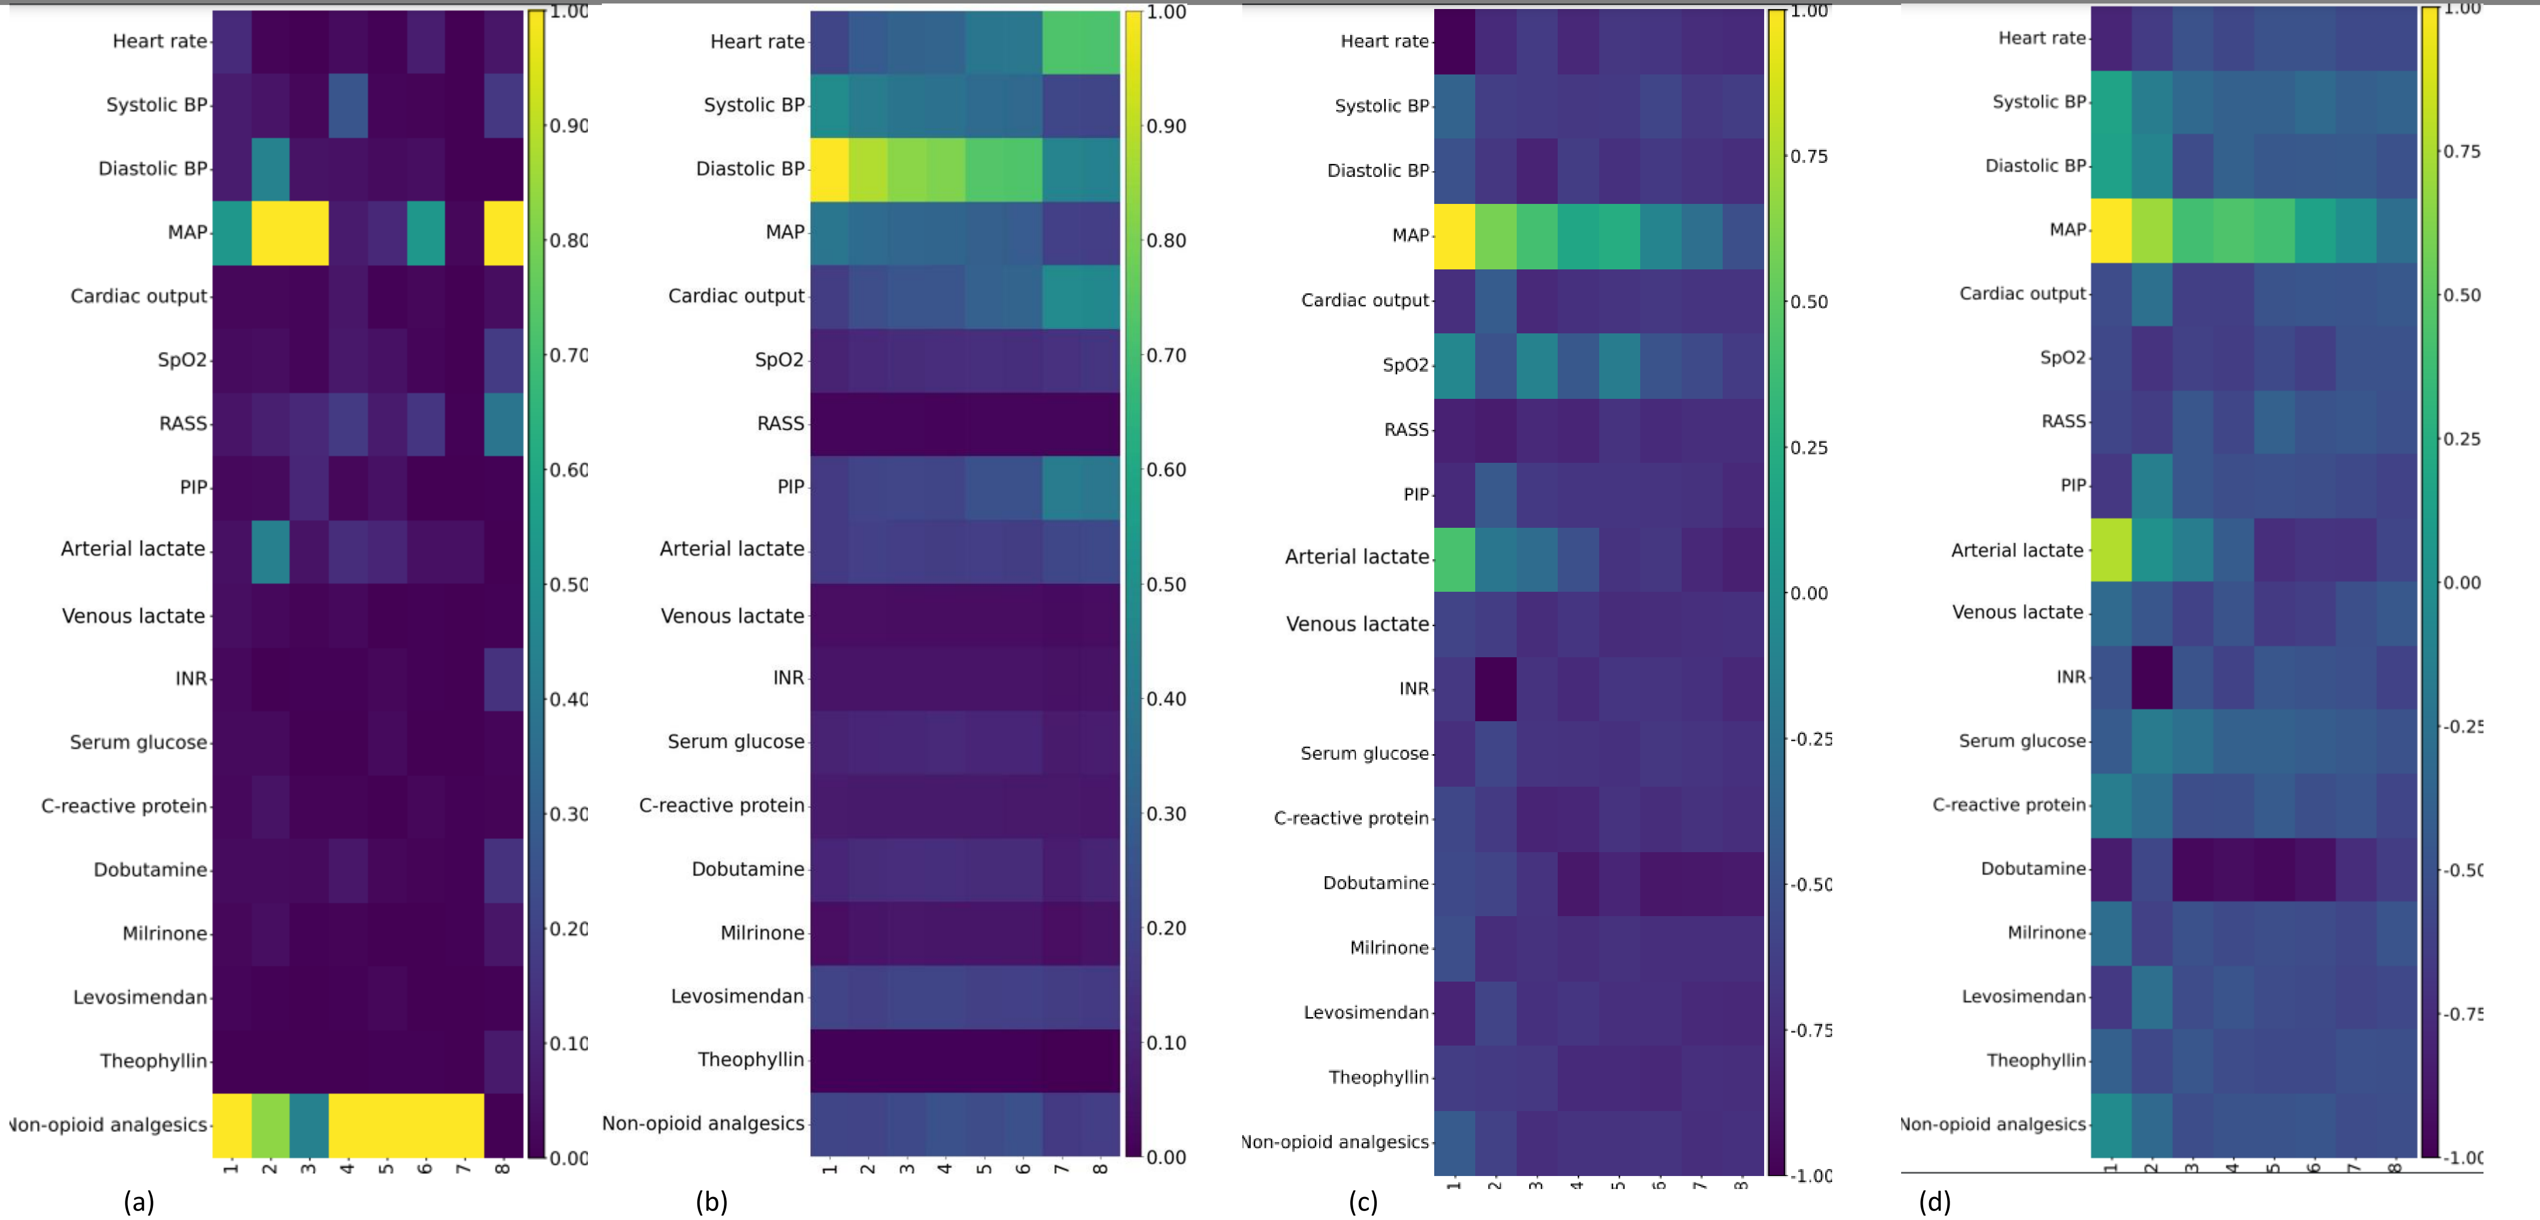
Comparison of explainability methods for MDR prediction in the test set. (a) CCMI scores, (b) Hadamard attention weights, (c) IT-SHAPfeature contributions using an RNN without Hadamard attention, and (d) IT-SHAP feature contributions using an RNN with Hadamard attention. Thex-axis represents time steps, and the y-axis corresponds to variables under analysis, with the color scale indicating variable importance at eachtime step.

CIRCULATORY FAILURE – LSTM (SPLIT 3)



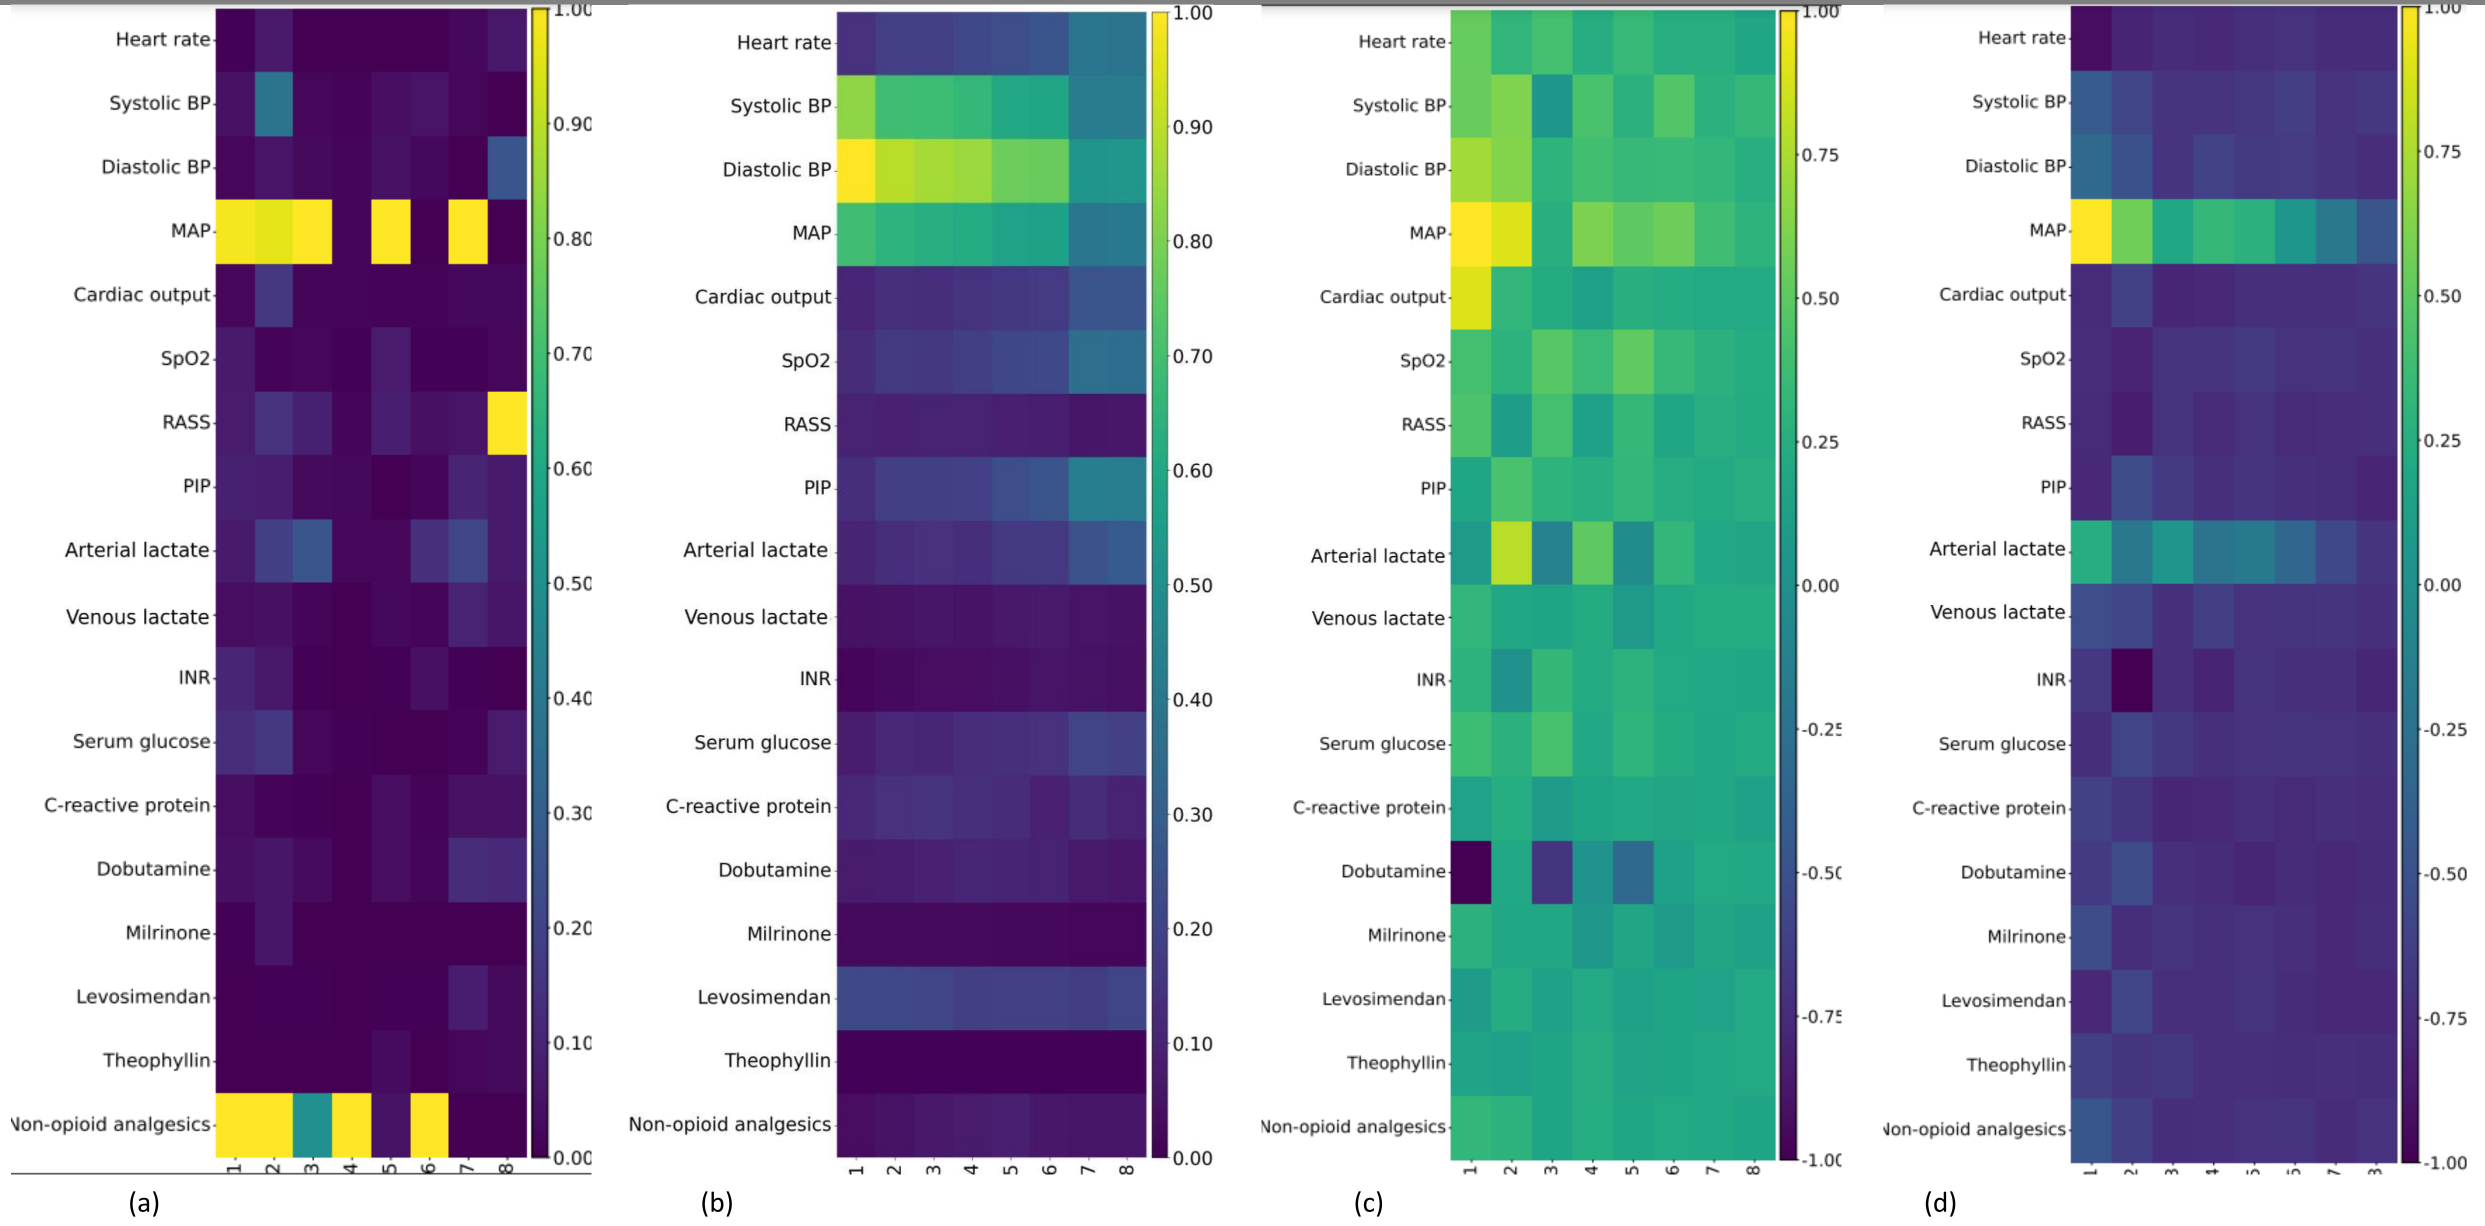
Comparison of explainability methods for MDR prediction in the test set. (a) CCMI scores, (b) Hadamard attention weights, (c) IT-SHAPfeature contributions using an RNN without Hadamard attention, and (d) IT-SHAP feature contributions using an RNN with Hadamard attention. Thex-axis represents time steps, and the y-axis corresponds to variables under analysis, with the color scale indicating variable importance at eachtime step.

CIRCULATORY FAILURE – Vanilla RNN (SPLIT 1)



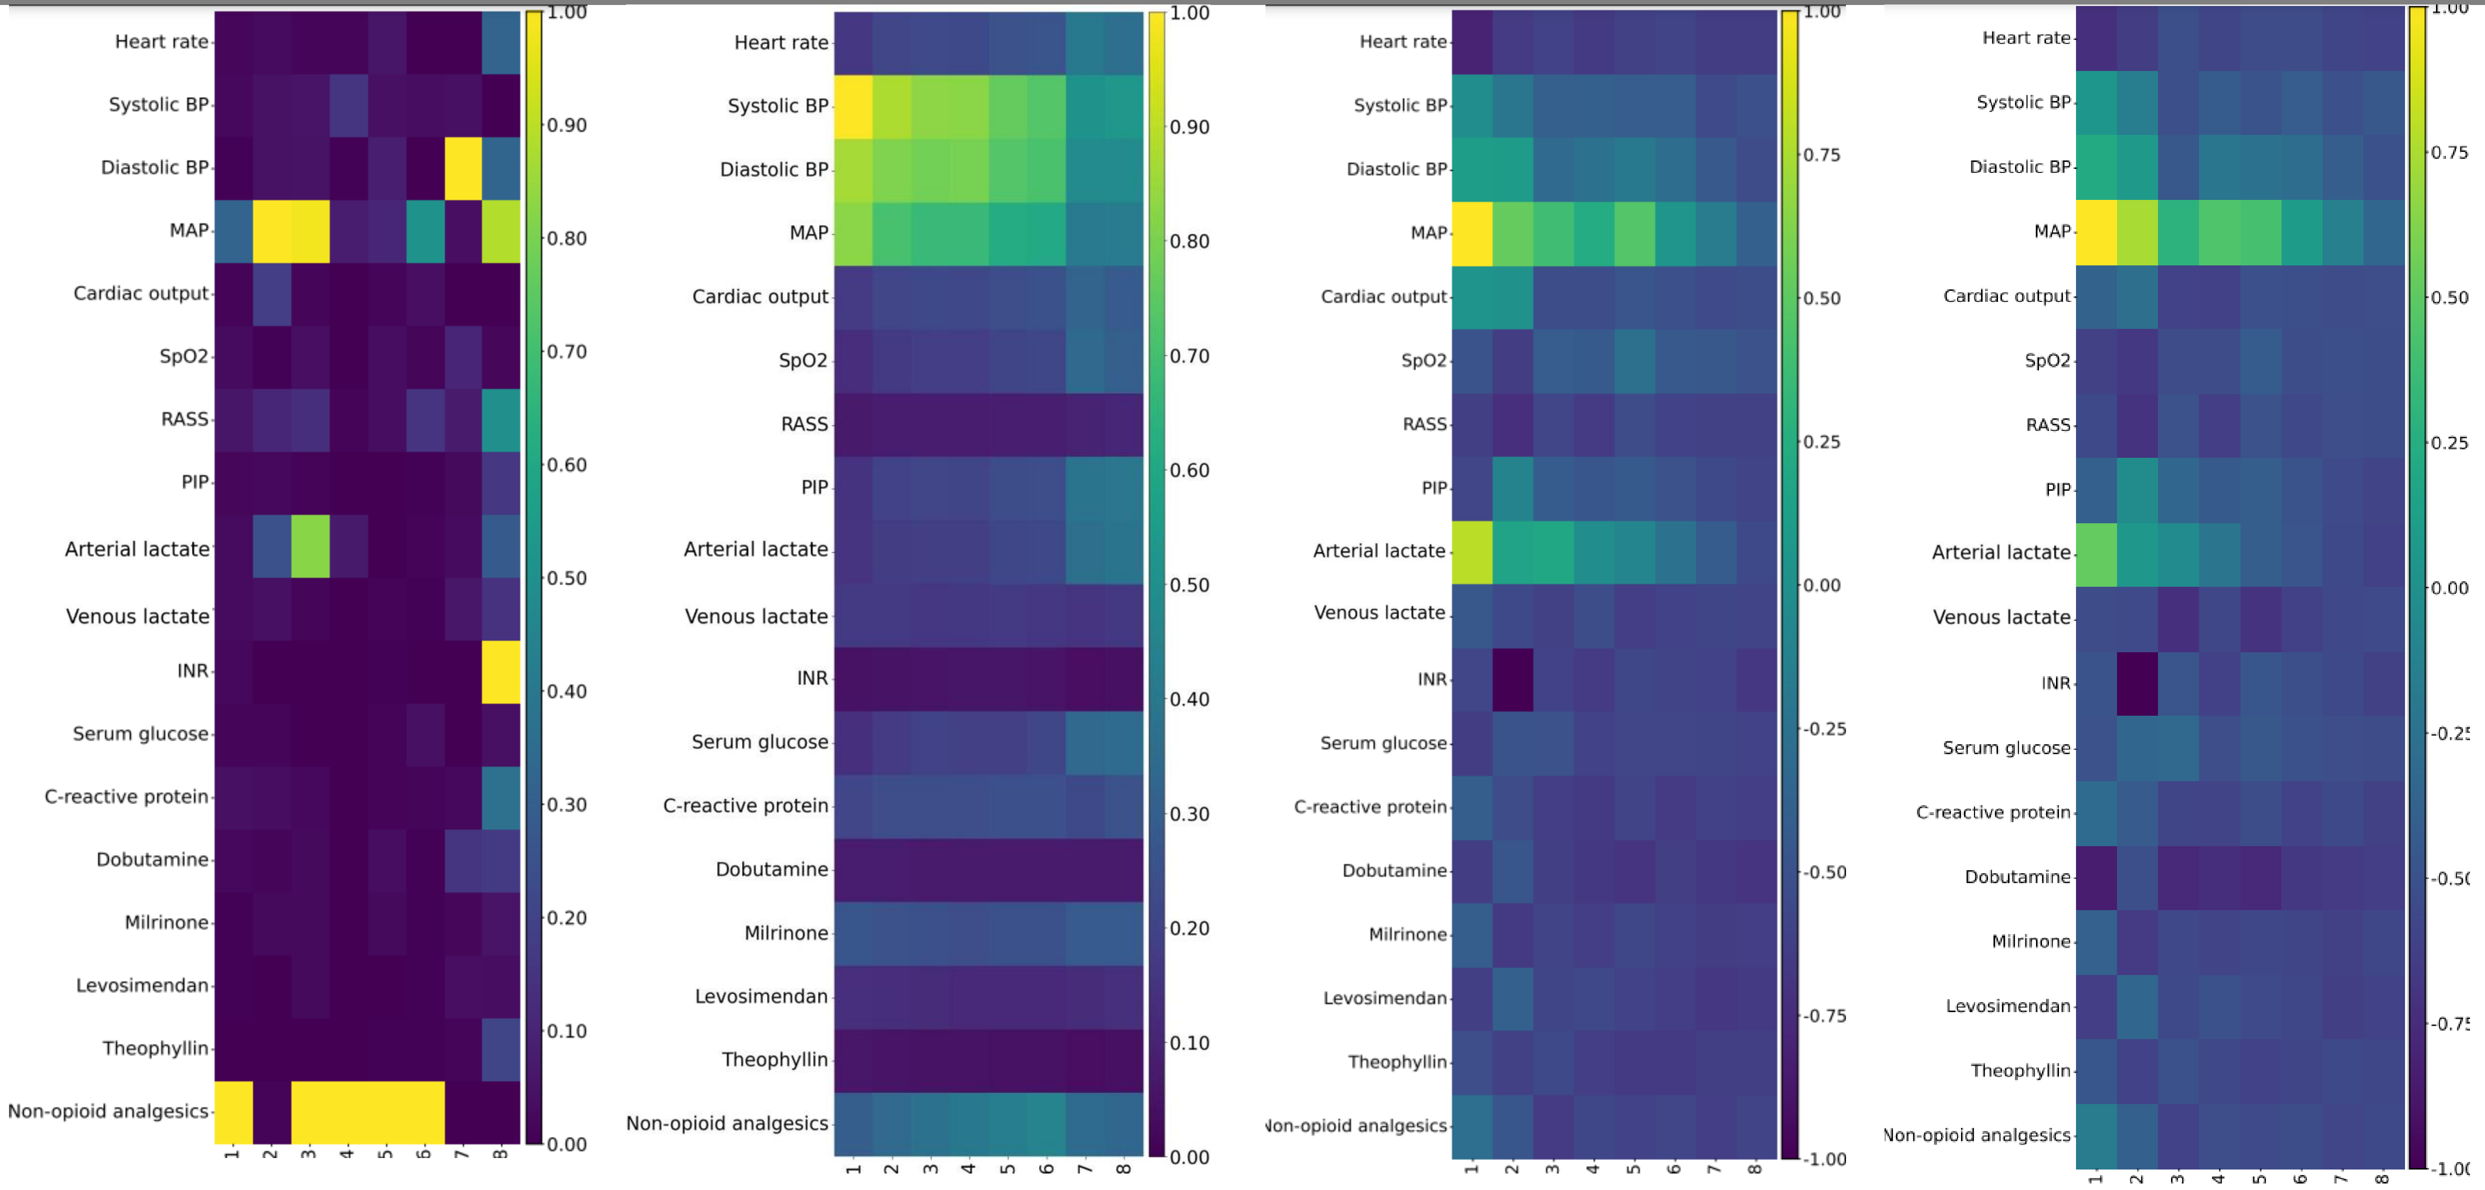
Comparison of explainability methods for MDR prediction in the test set. (a) CCMI scores, (b) Hadamard attention weights, (c) IT-SHAPfeature contributions using an RNN without Hadamard attention, and (d) IT-SHAP feature contributions using an RNN with Hadamard attention. Thex-axis represents time steps, and the y-axis corresponds to variables under analysis, with the color scale indicating variable importance at eachtime step.

CIRCULATORY FAILURE – Vanilla RNN (SPLIT 2)



Comparison of explainability methods for MDR prediction in the test set. (a) CCMI scores, (b) Hadamard attention weights, (c) IT-SHAPfeature contributions using an RNN without Hadamard attention, and (d) IT-SHAP feature contributions using an RNN with Hadamard attention. Thex-axis represents time steps, and the y-axis corresponds to variables under analysis, with the color scale indicating variable importance at eachtime step.

CIRCULATORY FAILURE – Vanilla RNN (SPLIT 3)



(a) (b) (c) (d)

Comparison of explainability methods for MDR prediction in the test set. (a) CCMI scores, (b) Hadamard attention weights, (c) IT-SHAPfeature contributions using an RNN without Hadamard attention, and (d) IT-SHAP feature contributions using an RNN with Hadamard attention. Thex-axis represents time steps, and the y-axis corresponds to variables under analysis, with the color scale indicating variable importance at eachtime step.
